

FIRE HYDRANT FLOW TESTING

Fire Hydrant Flow Testing Fee:

\$ 500.00

A fire flow test is performed on a pair of hydrants – one hydrant acts as the residual hydrant and one acts as the flow hydrant.

These tests are required by local Fire Departments to ensure that new developments meet the current fire flow and fire protection requirements.

Fire flow tests can also be performed for engineering firms that design water systems for new development, design fire protection systems for buildings, landscape irrigation systems and residential customers with high or low pressure problems.

These tests require a considerable amount of time for staff to perform, must be scheduled around weather conditions as well as other planned activities and result in considerable quantities of non-revenue water being flushed during the process.

The process and fee will be periodically reviewed and adjusted accordingly to address issues and concerns.
