SECTION D – TECHNICAL SPECIFICATIONS

DIVISION II 2000 – SPECIAL PROVISIONS

PART 1.

1.01 PURPOSE

These Special Provisions are intended to supplement and amplify the requirements of these Contract Documents. Where any article or item of these Contract Documents are modified or deleted by this section, the remaining unaltered provisions of that article, paragraph, subparagraph, or clause shall remain in effect. In the event of a conflict, these Special Provisions shall take precedence.

1.02 CUSTOMER SERVICE

The Contractor is expected to make every effort to reduce the impact of their operation to Fayetteville Public Works Commission's (PWC) operation and maintenance of the water and sewer system, and the affected customers within the project area. Full cooperation and coordination with PWC personnel, other utilities, and customers is expected. It shall be expected that the Contractor will promptly respond to any concerns voiced by customers and/or PWC personnel, and make every effort to resolve them immediately. Providing exemplary customer service shall be incidental to this Contract, and no additional payment will be made for this service.

1.03 REPLACEMENT OF FENCING

The Contractor is to replace any fencing disturbed as part of their operations for the work described within these Contract Documents. Fence replacement is considered incidental to the operation, and no additional payment will be made for this work. In addition, if temporary fencing is required, the Contractor shall provide such fencing as necessary, at no additional cost to the Owner. The Contractor is responsible to coordinate the fence removal and replacement for both the temporary and permanent placement with the property owner. Fences shall be removed and replaced, using new materials as required, to restore the fence to the original condition or better.

1.04 PRECONSTRUCTION VIDEO

The Contractor shall complete a pre-construction video inspection of the project area, to document pre-existing conditions. The video shall be in a playable electronic video format (i.e.AVI, .WMV, .MOV, .MP4) contained on a high capacity flash drive or portable external drive. The intent of this video is to document the roadside conditions, easement areas, the driveways, the condition of the curb and gutter, the condition of the mailboxes, fences and gates, retaining walls, any other resident installed improvements; and the condition of the sod. It is advised that the video start on one side of the street, proceed to an intersection and then return down the other side. An additional pass showing the road centerline from a high viewing angle is preferred but not necessary. The Contractor shall also include any easement areas, especially those passing through yards, driveways, etc. The video must identify the house number and the street name in the audio track and visually. The video must be accompanied by an index sheet identifying the streets of the project by time position on the

video. The Contractor may also include any pre-existing conditions they want brought to the attention of the Project Engineer by including notes and time position on the index sheet. The Contractor can also include still pictures of the areas, for additional documentation. Two (2) copies of the video and any other accompanying data shall be submitted to the Project Engineer before the first payment application can be released and the cost for the video shall be incidental.

1.05 PROJECT SIGN

The project sign(s) shall be submitted, approved, and installed prior to the start of construction activities. The Contractor shall install a project sign(s) within the project limits in the location(s) shown on the plans or as directed by the Owner, at no additional cost.

1.06 WORKING DAYS, EMERGENCIES, PUBLIC ACCESS, AND MEETINGS

A. WORKING DAYS & HOURS

Regular working hours shall not exceed 40 hours per week, 8 hours per day (between the hours of 7:00 a.m. and 5:00 p.m.) Monday through Friday. No work is permitted on legal holidays (to include holiday weekends). No work, unless otherwise required due to an emergency and authorized by the Fayetteville Public Works Commission, shall be performed on weekends or after hours without prior written approval from the Fayetteville Public Works Commission. Requests to work other than regular working hours must be submitted in writing to the Fayetteville Public Works Commission a minimum of two (2) full business days in advance in order to arrange for appropriate personnel to be at the site of the Work. Requests shall only be approved if the Fayetteville Public Works Commission determines that the work is necessary in order to meet the Contract completion date. The written request shall include a proposed schedule for the work to be completed.

During the course of construction, it may be necessary to complete portions of the Work outside the normal working hours, to accommodate the utility owner's operations, traffic, and/or public convenience. The Contractor, Project Engineer and utility owner will determine an acceptable schedule required for work during such hours. The costs for such Work shall be considered incidental to the Project and no additional payment will be made.

Inspector Overtime shall be charged during those times when the Contractor is authorized to work outside of the normal working hours outlined above. The overtime will be charged at \$80.00 per hour. The Project Coordinator shall be present at all times when the Contractor is approved to work outside of normal hours. The overtime charge will be deducted from the Contractor's pay application. Inspector overtime may be waived for circumstances beyond the Contractor's control as deemed by the Project Engineer or Project Coordinator.

During normal working hours and days, the Contractor shall have all equipment, materials, and personnel out of the work area (to include easements) by 5:00 p.m., unless specific permission has been granted by the Owner. Should the Contractor fail to have all equipment, materials, and personnel out of the work area by 5:00 p.m., the Owner shall assess a penalty of \$250 per 30-minute interval or any portion thereof, until the Contractor has left the site. This penalty will be deducted from the Contractor's pay application or be billed directly to the Contractor. The penalty may be waived for circumstances beyond the Contractor's control, as deemed by the Project Engineer or Project Coordinator.

Should the Contractor be granted permission to work outside of the normal working day or time, the Contractor shall adhere to the time restrictions agreed to in the Project Engineer's approval of the request. The Contractor will be assessed a penalty of \$250 per 30-minute interval for any portion thereof, should the Contractor fail to leave the site at the agreed upon time. Inspector overtime will be charged during the approved hours, as outlined above. The penalty may be waived for circumstances beyond the Contractor's control, as deemed by the Owner.

Note: The Contractor, may, without penalty, complete servicing of equipment in the approved staging yard after normal work hours.

Legal holidays observed by the Owner include New Year's Day, Martin Luther King's Birthday, Good Friday, Memorial Day, Independence Day, Labor Day, Thanksgiving (2 days), and Christmas (2 days). Should the Contractor or subcontractor operations shut down for a period of time exceeding three (3) consecutive calendar days all equipment shall be secured in the approved storage yard. Equipment shall not be stored in the right of ways of the project beyond a period of three (3) consecutive calendar days unless approved in writing by the Project Engineer.

B. EMERGENCY RESPONSE

The Contractor shall maintain a construction crew capable of performing emergency maintenance work 24 hours a day, 7 days a week to include all holidays. As a minimum, phone numbers shall be furnished for at least three (3) individuals in responsible charge (capable of making company binding decisions) to be available at all times (24 hours a day, 7 days a week to include all holidays). The emergency phone numbers and responsible individual's names will be provided to the Project Engineer. In the event of an emergency, PWC Dispatch will contact the Contractor and the Project Coordinator. The Contractor's designated emergency personnel shall be expected to respond and perform emergency maintenance work immediately, in less than two (2) hours, or the work will be performed by the appropriate utility owner and all associated costs billed to the Contractor.

Once onsite the Contractor shall notify the PWC's Emergency Dispatcher (910-678-7400) of the problem, the anticipated response time and the estimated time required to complete the repair work (AQUA Emergency 877.WTR.AQUA or 877.987.2782). It is the Contractor's responsibility to immediately respond to any emergency in their project area. It is expected that the Contractor will have the appropriate repair materials on-site in order to provide an immediate response to any water, sewer, street, and/or storm emergency. Should it be determined that the cause of the water, sewer, street and/or storm emergency is not the fault of the Contractor, reimbursement of their expenses related to the repairs will be made. No reimbursement to the Contractor shall be made for repairs resulting from the Contractor's actions and/or negligence.

C. OFFICE FACILITIES

The Contractor shall provide at his expense telecommunications via cellular phone at all times on the job site. The Project Superintendent must be onsite and accessible by telephone at all times while work is progressing. The Project Superintendent shall have access to plans, contract documents, permits, and encroachment agreements at all times whether an office facility is provided by the Contractor or not.

D. CONSTRUCTION MEETINGS

During the construction period, monthly project progress meetings shall be scheduled by the Project Engineer and the Contractor's attendance will be mandatory. The scheduled date and times will be established by the Project Engineer. The cost for the Contractor to attend the monthly progress meetings shall be incidental to the Contract.

1.07 **PUBLIC CONVENIENCE**

A. CONTRACTOR'S DUTY AND OBLIGATION TO THE PUBLIC

The Contractor at all times shall conduct the work in such a manner as to ensure the least obstruction to traffic practicable. The convenience of the general public and of the residents and businesses along and adjacent to the street(s) shall be provided for in a satisfactory manner, consistent with the operation and local conditions. The Contractor shall construct and maintain any necessary ramps, boardwalks, or other means to maintain pedestrian traffic. Costs for such work shall be incidental to the unit prices bid. The Contractor shall at all times cooperate with the public and merchants affected by the construction operations and shall maintain good public relations at all times.

The Contractor shall schedule and stage construction in a sequence to minimize disruption to the largest number of residents/businesses for the shortest period of time. Special considerations shall be given to the neighborhood solid waste and trash collection schedule, mail delivery, and bus routes, if applicable.

B. PUBLIC SAFETY

The Contractor shall barricade all work, roads, etc. to keep the public away from the construction. The Contractor shall provide protection to all portions of the Work when the work is not in progress. The Contractor shall provide and install all measures necessary to protect the public. Damage due to the lack of proper protection shall be the Contractor's sole responsibility.

The Contractor and subcontractors shall be responsible for any damage to any Owner's property, private property, or property owned by other utilities. The Contractor shall repair all damage to as good as or better than existing conditions. The Contractor and subcontractors shall be responsible for and pay any claims.

C. JOBSITE REQUIREMENTS

In addition to requirements outlined in these Contract Documents, the following are mandatory requirements that will be strictly enforced:

- Posted speed limits shall be strictly adhered to. No speeding.
- Driveways shall not be blocked without prior notification and coordination with the resident.
- To the maximum extent possible, one lane of traffic shall be maintained at all times.
- Excess soil, stone, equipment, materials, etc. in the road or along the right-of-way shall be removed at the end of each work day. Soil, stone, millings, pipe, etc., shall not be stored or stockpiled in the road right-of-way.

- All trenches, excavations, or other hazards in the vicinity of the work shall be well barricaded and properly lighted at night.
- Mailboxes and traffic signs shall be only removed as necessary to facilitate the installation of the Work and shall be reinstalled during the same day of removal. Any damages to mail boxes, signs or posts shall be repaired by the Contractor at no cost to the Owner.
- Portable toilets shall be provided for workers. These facilities shall be placed discretely out of public view, kept clean, and orderly.
- Contractor(s) shall not enter onto private property for the purpose of using water or electricity without the written permission of the property owner.
- The use of profane or abusive language or obscene gesturing by workmen will not be tolerated and will be just cause for immediate dismissal from the project site as directed by the Owner or its authorized representative.
- OSHA safety measures are to be maintained at all times.
- An English-speaking Contractor's representative is required for each separate work crew.
- Do not litter at any time.
- Respond to all complaints within 24 hours.
- Wear proper protective clothing (hard hats, shoes, shirts, etc). Personnel must wear an approved safety vest at all times while working on the Owner's project.
- During the installation of the utilities, the excavated material may be temporarily stockpiled adjacent to the work area. In no case shall stockpiled material be allowed to remain for a period of time exceeding the work day.
- The trench shall be completely backfilled at the end of each work day.
- If construction is temporarily halted during the work day, the open trench shall be manned continuously.
- Damage to sod and/or grass along the street right-of-way due to (but not limited to) temporarily stockpiled material, construction travel and other construction related activities shall be replaced with sod at the Contractor's sole expense.

D. INTERMEDIATE COMPLETION

When deemed necessary by the Project Engineer, the Contractor shall complete his work to such a point as designated. Completion of the work to the designated point shall not be considered an acceptance of the project or any part of it, or as a waiver of any of the provisions of these Contract Documents. Necessary repairs or renewals made on any section of the Work, which has been completed under instructions from the Project Engineer, due to defective materials or work pending completion and acceptance, shall be performed at the expense of the Contractor.

PART 2.

CONSTRUCTION REQUIREMENTS

2.01 EROSION AND SEDIMENT CONTROL

A. EROSION AND SEDIMENT CONTROL PLAN

The provisions of The Sedimentation Pollution Control Act of 1973 as implemented by Title 15, N.C. Administrative Code, Chapter 4, Sedimentation Control, Subchapters 4A,

4B and 4C as amended (5 NCAC 4A, 4B and 4C), shall be applicable to this project. The Owner has secured an approved plan from the North Carolina Department of Environmental Quality (NCDEQ).

Minimum requirements for erosion control are shown on the drawings, based on anticipated construction methods. The Contractors shall adjust the measures to complement their type of construction and prevent the transmittal of silt. All fees, penalties, fines for non-compliance, and all civil actions resulting therefrom shall be the Contractor's responsibility and shall in no way involve the Owner. The Contractor shall notify the Owner immediately of any fine, penalty, or notice of non-compliance by NCDEQ. The Contractor may be required to modify or supplement the approved measures at no additional cost to the Owner. All erosion control measures shall remain serviceable until the site is restored and stabilized, upon such time the measures shall be removed by the Contractor, and final payment may be approved.

The Contractor shall be required to prepare and obtain an approved erosion control plan addressing staging/storage areas, haul roads, borrow pit operations and/or disposal/waste areas. The Contractor shall pay all fees associated with the supplemental plan and a copy of the NCDEQ approved plan shall be furnished to the Owner. Work cannot begin until the plan is approved. Permanent and temporary erosion control measures proposed by the Contractor for staging areas, haul roads, etc. shall be at the Contractor's expense and shall not constitute additional compensation.

The Contractor shall be required to display at the job-site office (or readily available on the project site) both the Owner's Erosion Control Permit and the Contractor's Erosion Control Permit.

2.02 SITE WORK

A. SITE LAYOUT AND STAKING

Construction staking will be performed by the Design Engineer who will also prepare and furnish construction cut sheets to the Owner and Contractor. The Contractor shall not install any utilities without a cut sheet. All requests for staking will be made not less than 96 hours in advance.

Utilities shall be installed at the locations and elevations indicated on the cut sheets unless otherwise approved by the Owner. Should a conflict arise between the Contract Drawings and the cut sheets, the cut sheets shall take precedence. Contractor shall make the Project Coordinator aware of any conflict between the Contract Drawings and the cut sheets as soon as it is discovered. The Contractor shall verify invert elevations of all water mains, sewer mains, water laterals, sewer laterals, and manholes by instrument.

2.03 UTILITIES

A. OWNERSHIP OF EXISTING UTILITIES

Existing utilities indicated on the Plans to be abandoned shall remain the property of the utility owner. The Contractor shall be responsible for removing the existing utilities as noted on the plans and removing the material from the site unless otherwise directed by

the utility owner. The utility owner shall have the right of first refusal regarding the salvage of the material.

B. CONSTRUCTION AROUND UTILITY POLES AND GUY WIRES

The Contractor will be required to perform construction work around utility poles and guy wires which may be left in place within the construction limits of the project. The Contractor shall contact the owner of the utility to coordinate securing the poles during construction. It may be necessary for the Contractor to hire an electrical utility contractor to secure poles. All work outlined in this paragraph shall be at no additional cost to the Owner.

C. UTILITY COORDINATION

Coordination with the Project Engineer, Project Coordinator, and utility owner shall be a requirement of this Contract.

Coordination of temporary interruptions to gas, electric, cable and telephone services shall be the responsibility of the Contractor. The Contractor shall schedule a coordination meeting with the Project Coordinator, Project Engineer and the utility owner a minimum of three (3) business days prior to any planned service interruption.

Coordination of temporary interruptions to water and/or sewer services shall be the responsibility of the Contractor. The Contractor shall schedule a coordination meeting with the Project Coordinator, Project Engineer, and utility owner a minimum of three (3) business days prior to any planned service interruption. The duration of the service interruption shall be coordinated with the utility owner and the Project Coordinator. Service interruptions to residents shall be limited to no more than eight (8) hours at any given time. If the service interruption is anticipated to exceed eight (8) hours, temporary service shall be provided. The Contractor shall provide all the necessary equipment and materials for temporary service. The notifications shall describe the work to be undertaken and approximate dates of the work. The text of the notifications shall be approved by the PWC in advance. The Contractor shall furnish a copy of the notification to the Project Coordinator each time such notification is issued to the residents.

Whenever the property owner's use of the water and/or sanitary sewer must be interrupted by the Work, the Contractor shall notify the residents a minimum of 48 hours prior to service interruption. This notification shall be accomplished with door hanger notification cards placed at the addresses of the affected residents. Property owners shall be informed when service interruption takes place and the expected duration. The Contractor shall make every effort to minimize inconvenience to the public and property owners.

For service interruptions on PWC's water system, refer to the 'Water Outage' requirement in Section 2.05 of these Special Provisions.

The utility owner shall supervise the Contractor's operation of their facilities within the work area.

D. PROTECTION OF EXISTING UTILITIES

The Contractor shall take every precaution to prevent damage to existing utilities. Any damage to existing utilities shall be replaced or repaired by the Contractor.

If existing water and/or sewer utilities are damaged, the Contractor shall immediately notify the utility owner and the Project Coordinator. The Contractor shall immediately commence repairs to the damaged water and/or sewer utility in accordance with the utility owner's requirements. The Contractor shall ensure that no debris from construction operations is allowed to enter the existing sewer system.

If the Contractor damages other utilities (CATV, telephone, etc.) the Contractor shall immediately notify the utility owner and Project Coordinator.

Any damage to the City of Fayetteville's storm drainage infrastructure shall be repaired in accordance with City of Fayetteville requirements within seven (7) business days after damage occurs. All costs associated with the required repairs shall be the responsibility of the Contractor, at no cost to the Owner.

E. SPILL RESPONSE

The Contractor shall not discharge or pump any sewage, solids, or debris on the ground, streets, storm water system, ditches, or streams. Any sewage spills shall be immediately reported to the PWC Water Resources Construction Department, (910) 223-4716. After normal business hours, the Contractor shall contact the PWC dispatch center, (910) 678-7400.

In the event that raw sewage is spilled, discharged, leaked or otherwise deposited in the open environment, due to the Contractor's work, the Contractor is responsible for any clean-up of solids and disinfection of the area affected. This work will be performed at the Contractor's expense with no additional cost to the Owner. The Contractor is also responsible for complying with all regulatory requirements in regards to the size spill with no additional cost to the Owner. The Contractor shall cooperate fully with the Owner and the applicable state agencies in responding to and cleaning up the spill. Any work completed by the Owner in responding to a spill caused by the Contractor's operations shall be billed to the Contractor.

Where sewage has backed up into a property due to the Contractor's operation, the Contractor shall immediately notify the Owner, inspect the property with the Owner's representative and agree on remedial measures. The Contractor shall be responsible for all cleaning, repair and/or replacement of damaged property, temporary relocation of all occupants of the affected properties, if required, all to the satisfaction of the property owner. These actions shall be undertaken immediately upon learning of the backup. Cleaning shall be performed by firms specializing in this type of work. All costs associated with the cleaning, repair, replacement of damages, occupant accommodations, insurance and spill remediation shall be the responsibility of the Contractor. All remediation measures required as part of a spill response are part of acceptance of the project, and final payment shall not be made until such time all required measures are addressed and approved by the appropriate regulatory agency.

F. DAMAGE TO EXISTING UTILITIES

If the Work is delayed as a result of damage to an improperly marked utility, the Contractor may request an extension of the Contract Time in accordance with these Contract Documents. Should the Contractor determine compensation for the delay is also warranted, the Contractor shall submit a claim to the utility owner. Adjustments to the

Contract Price will not be made due to delays or additional work resulting from damage to existing utilities that are not properly located.

If the Work is delayed as a result of damage to a properly marked utility, no additional Contract

Time or compensation shall be granted.

G. CROSSING OF ASBESTOS-CEMENT WATER MAINS

Where the proposed sewer main crosses an existing PWC water main, the Contractor shall pothole the existing water main to verify the pipe material. If the existing water main material is asbestos-cement (AC), the Contractor shall replace a minimum of 20 feet of the water main with ductile iron. It is the Owner's sole determination as to the length of water main to be replaced. The replacement shall be scheduled so that it is completed prior to the sewer installation. All required notification to affected customers shall be done in accordance with these Contract Documents. Installation of the new ductile iron water main shall be in accordance with PWC requirements. The Contractor shall follow all applicable federal, state, local rules and regulations regarding cutting and disposing of AC pipe.

NOTE: THIS REQUIREMENT DOES NOT APPLY TO THOSE WATER MAINS OWNED BY AQUA AMERICA.

H. CROSSING EXISTING OR PROPOSED UTILITIES

The Contractor shall conduct their operations so that the following requirements are adhered to:

1. Underground telephone, cable TV, and gas utilities or conduit banks shall be crossed maintaining a minimum of 12-inch separation or clearance.
2. Electrical crossings shall be performed while the conductor is de-energized and at all times in the presence of the utility owner. Electrical crossings shall be in accordance with NESC requirements. Electrical primary conductor crossings shall be as follows:
 - a. Crossing over a conductor, maintain a minimum of 12-inches of undisturbed soil encasing the conductor.
 - b. Crossing under a conductor shall be accomplished by boring, maintaining 12-inches of undisturbed soil encasing the conductor.

No separate payment shall be made for this work.

I. REPLACEMENT OF PWC WATER SERVICES

The Contractor shall replace the existing water services that are damaged as a result of their operations in accordance with PWC standards. Damaged water services shall be replaced from the meter to the existing main utilizing copper tubing and all new fittings. The Contractor shall properly abandon the existing tap, and install a new tap, utilizing a new tapping saddle and corporation in accordance with PWC standards.

The Contractor shall be responsible for connecting the new tailpiece to the customer's existing service utilizing brass fittings. The Contractor is responsible for all necessary fittings in order to connect the copper tubing to the existing meter.

The existing meter boxes shall be replaced as part of the renewal of the water services. A composite, H-20 rated meter box shall be used if the meter is to be located in asphalt or concrete. The Contractor shall be responsible for furnishing and installing the meter boxes. All work shall be approved by the Project Coordinator.

Should the Project Engineer determine that an existing water service be replaced, the Contractor shall replace that service in accordance with the above paragraphs.

J. REPLACEMENT OF WATER SERVICES (AQUA)

The Contractor shall replace the existing water services that are damaged as a result of their operations, with 1-inch polyethylene CTS, 200 PSI pipe for doubled services. Should the service encountered be a single service it shall be replaced with ¾-inch CTS 200 PSI pipe. The services shall be replaced main to meter. In accordance with AQUA America requirements, no couplings shall be used on service lines. Single strap saddles made of brass shall be used with brass compression corporation stops. All water laterals shall have at least three (3) feet of cover. Should the Contractor's operations damage properly marked services they shall be replaced at no cost to AQUA America or the Owner. If services are not properly marked the Contractor will need to seek reimbursement through AQUA America. The Contractor shall properly abandon the existing tap, and install a new tap, utilizing a new tapping saddle and corporation. The Contractor is responsible for all necessary fittings in order to connect the new service to the existing meter. The Contractor shall be responsible for furnishing and installing meter boxes. All work shall be approved by the Project Coordinator and AQUA America.

K. SEWER AND WATER LATERALS

During construction it may be necessary to change the proposed lateral location(s). The Contractor shall coordinate with the Project Coordinator to establish the new location and invert elevation to install the lateral. If the location of the lateral changes prior to installation, the Contractor shall install the lateral at no additional cost to the Owner. If the location changes after installation, the Contractor may submit a request for additional compensation in accordance with these Contract Documents. The existing lateral and main connection shall be abandoned in accordance with PWC requirements.

L. FIRE HYDRANTS

Existing fire hydrants shall be accessible to the Fire Department at all times. Fire hydrants shall not be taken out of service without the utility owner's written approval. The Fire Department shall be notified of any fire hydrant taken out of service.

2.04 TESTING

A. PRE-TESTING

The Contractor shall perform all water system and/or sewer system pre-testing satisfactorily prior to scheduling the test to be observed by the Project Coordinator. Pre-testing shall include mandrel pulling; pressure tests for water mains and laterals; vacuum

testing manholes; air/pressure tests for sewer mains and laterals; and pressure testing force mains.

B. TESTING

The Contractor shall coordinate and fully cooperate with the Project Coordinator when scheduling testing. The Contractor shall provide a minimum of two (2) business days' notice when scheduling testing with the Project Coordinator. All testing, to include a final visual inspection (mirror), shall be in accordance with these Contract Documents.

The Contractor shall provide all equipment, materials, personnel, traffic control and all means necessary to perform all testing and inspection at no additional costs to the Owner. If the same line segment and/or manhole fails the required testing more than two (2) times, the Contractor shall be charged a fee of \$100.00 per test, beginning with the 3rd attempt, until a passing test is achieved. The fee shall be deducted from the Contractor's monthly pay application.

C. COMPACTION REQUIREMENTS

Volume II of these Contract Documents contains compaction requirements in Specification Section 02222. The testing requirements listed below specifically pertain to annexation projects. This procedure shall be used at all times.

Tests for density of compaction are made at the sole direction of the Project Engineer or the Project Coordinator. All deficiencies shall be corrected by the Contractor without additional cost to the Owner. The following outlines the requirements for compaction testing:

SEWER MAIN

For every section of sewer main line less than 250 feet between manholes, one (1) test series each shall be completed at the 95% and 98% compaction zones (for a total of two tests). For sections of sewer greater than 250 feet between manholes, two (2) test series shall be completed at the 95% and 98% compaction zones (for a total of four tests). Additionally, for the sub-grade, one (1) test shall be taken on each street or every 250 feet (whichever is shorter).

If a compaction test fails, the Contractor, at his option and cost, can perform two (2) additional tests fifteen (15) feet on either side of the failing test. If those two tests pass, the Contractor is required to re-excavate and re-compact that section between the passing tests. If one (1) of the tests fails, the Contractor shall re-excavate and re-compact from the passing test to the next manhole. If both tests fail, the Project Coordinator has the sole option to require another compaction test deeper within the zone (i.e., 95% compaction). This additional test shall be done at the Owner's cost. Should this additional test fail, the Contractor shall re-excavate and re-compact the entire zone from manhole to manhole. Should the Project Coordinator elect not to complete an additional compaction test at a deeper depth, the Contractor shall re-excavate and re-compact the entire section at the test elevation, from manhole to manhole. Any section re-excavated and re-compacted shall be re-tested in accordance with these specifications. Each retest (bracket or otherwise) will be at no cost to the Owner. Contractor will only receive payment for mainline pipe if it has passed compaction testing requirements.

For every lateral installed on the project the Project Coordinator shall request, at a minimum, one (1) out of every three (3) laterals be tested. It is the Project Coordinator's sole option in determining the location and number of laterals to be tested. If a compaction test fails, the Contractor must re-excavate and re-compact the failing location and the other two (2) laterals in the group. Each retest will be at no cost to the Owner. The Contractor shall only receive payment for laterals that pass compaction testing requirements. Additionally, for the sub-grade, tests may be taken at the discretion of the Project Coordinator.

WATER MAIN

For testing of water main trench backfill, one (1) test series shall be completed at the 95% and 98% compaction zones (for a total of two tests) per street/easement area or every 250 feet, whichever is shorter. To test the sub-grade, one (1) test shall be taken on each street/easement area or every 250 feet whichever is shorter.

If a compaction test fails, the Contractor, at his option and cost, can perform two (2) additional tests fifteen (15) feet on either side of the failing test. If those two tests pass, the Contractor shall re-excavate and re-compact that section between the passing tests. If one (1) of the tests fails, the Contractor is required re-excavate and re-compact from the passing test to 125 feet either side of the original failing test. If both tests fail, the Contractor shall re-excavate and re-compact 125 feet of either side from the initial test, for a total of 250 feet. Any section re-excavated and re-compacted shall be re-tested in accordance with these specifications. Each retest (bracket or otherwise) will at no cost to the Owner. Contractor will only receive payment for mainline pipe if it has passed compaction testing requirements.

For every lateral installed on the project the Project Coordinator shall request, at a minimum, one (1) out of every three (3) laterals be tested. Additionally, for the sub-grade, tests may be taken at the discretion of the Project Coordinator.

It is the Project Coordinator's sole option in determining the location and number of laterals to be tested. If a compaction test fails, the Contractor must re-excavate and re-compact the failing location and the other two (2) laterals in the group. Each retest will be at no cost to the Owner. The Contractor shall only receive payment for laterals that pass compaction testing requirements.

STORM DRAINAGE

For every section of storm drainage less than 250 feet between structures, one (1) test series each shall be completed at the 95% and 98% compaction zones (for a total of two tests). For sections of storm drainage line greater than 250 feet between structures, two (2) test series shall be completed at the 95% and 98% compaction zones (for a total of four tests). Additionally, for the sub-grade, one (1) test shall be taken on each street or every 250 feet (whichever is shorter).

If a compaction test fails, the Contractor, at his option and cost, can perform two (2) additional tests fifteen (15) feet on either side of the failing test. If those two tests pass, the Contractor is required to re-excavate and re-compact that section between the passing tests. If one (1) of the tests fails, the Contractor shall re-excavate and re-compact from

the passing test to the next structure. If both tests fail, the Project Coordinator has the sole option to require another compaction test deeper within the zone (i.e., 95% compaction). This additional test shall be done at the Owner's cost. Should this additional test fail, the Contractor shall re-excavate and re-compact the entire zone from structure to structure. Should the Project Coordinator elect not to complete an additional compaction test at a deeper depth, the Contractor shall re-excavate and re-compact the entire section at the test elevation, from structure to structure. Any section re-excavated and re-compact shall be re-tested in accordance with these specifications. Each retest (bracket or otherwise) will be at no cost to the Owner. Contractor will only receive payment for mainline pipe if it has passed compaction testing requirements.

2.05 CONSTRUCTION REQUIREMENTS

A. ASPHALT

If the Contractor elects to mill the asphalt, the millings cannot exceed two (2) inches in size, and shall be swept into the trench and re-compact.

If the Contractor elects to saw-cut and remove the asphalt, the asphalt removed must be disposed of off-site at the Contractor's expense. The Contractor shall utilize aggregate base course (ABC) to backfill the trench to the level of the remaining asphalt.

It shall be the Contractor's responsibility to maintain the trench (swept, wetted, compacted, etc.) until the n is installed. No separate payment shall be made for maintenance of the trench. The maximum allowable disturbed trench shall not exceed 3,000 feet. No trench shall be left un-patched for a period of time greater than sixty (60) days after initial asphalt removal.

Immediately upon installation of the sewer and/or water main, the Contractor shall install ten (10) inches of ABC stone base in all open trenches (mains and laterals). It shall be the Contractor's responsibility to maintain the trench (swept, wetted, compacted, etc.) until the permanent pavement patch is in place. No separate payment shall be made for maintenance of the trench.

The Contractor shall install pavement patch in accordance with the applicable detail. The street crown shall be restored. The pavement patch shall match existing pavement within +/- one -quarter ($\frac{1}{4}$) inch. For NCDOT roadways, all pavement patching shall be in accordance with the approved encroachment.

Immediately prior to patch paving, the trench sides shall be saw-cut straight. The lateral trenches shall be patched at the same time as the main trench. The asphalt wedge curb shall be replaced in accordance with the Owner's requirements. Damaged curb outside of the trench limits shall be removed and replaced at the Contractor's expense.

The Contractor may excavate and grade the mainline and one (1) side of lateral trenches for paving one (1) calendar day ahead of scheduled paving. The lateral trenches on the opposite side of the road are to be excavated and graded just ahead of the paving operation. The Contractor shall provide a smooth transition eliminating any vertical drop from the existing pavement to the cut-out trench at all times. Transitions shall be installed

at the lateral trenches, manholes, the beginning and end points of the main line trench and all affected driveways. Transitions shall remain in place until the day patch paving occurs. Upon completion of the daily patch paving operation, the Contractor shall re-install any removed transitions until such time the paving operation resumes. If the paving operation does not resume within two (2) calendar days, all excavated trenches shall be backfilled unless otherwise approved by the Project Engineer. No separate payment for installation, maintenance, and removal of these transitions shall be made.

B. COORDINATION OF WORK

The Contractor shall maintain unobstructed access to all areas for other Contractors. The Contractor is required to conduct his operations in a manner that will not interfere with or damage work that is being performed by others. The Contractor shall coordinate his operations in a manner which will facilitate the progress of work in adjacent areas.

Any conflicts or interference that cannot be resolved through direct communication with other Contractors working on the site shall immediately be brought to the Project Engineer's attention for resolution. The Project Engineer's decisions regarding resolution of conflicts between Contractors shall be final and binding. The Contractor shall not claim extra compensation for delays caused by other Contractors unless such delays are clear violations of a prior coordination agreement facilitated by the Owner.

C. CONSTRUCTION FACILITIES

The Contractor shall be responsible for obtaining all temporary utilities required for construction at no additional cost to the Owner. The Contractor shall make all necessary arrangements for securing water for construction purposes. The Contractor shall contact the utility owner to obtain the necessary permit for the temporary water usage.

D. BULK WATER USAGE

The PWC will allow the Contractor to use water from its water system. The Contractor shall utilize proper backflow prevention devices when obtaining water from the PWC's system. The Contractor shall contact PWC's Environmental System Protection Department at 910-223-4704 to determine the required backflow prevention devices, and to obtain a bulk water use permit. The Contractor shall be responsible for the cost of the bulk water permit fee. The bulk water permit fee is an annual fee, and shall be paid by the Contractor each year that this Contract is in effect. The Contractor shall provide documentation on the amount of water used for their operations, and provide a monthly statement to the Project Coordinator.

Water usage from other utilities shall be done in accordance with the utility's requirements. Any and all fees shall be the Contractor's responsibility.

E. CLEANLINESS DURING CONSTRUCTION

The Contractor shall perform a daily clean-up of all dirt, debris, scrap materials and other items resulting from their operations. No open accumulation of refuse, surplus or scrap materials will be permitted. The Contractor shall legally dispose off-site all waste materials and other excess materials resulting from construction.

Failure of the Contractor to maintain a clean site, including streets, will be basis for the Owner to issue a written notice of non-compliance with the Contract. The Contractor shall comply with the notice within 24 hours or as directed. If the Contractor fails to comply, the Owner may authorize the cleanup to be performed by others and the costs shall be deducted from the Contractor's pay application.

F. DUST CONTROL

The Contractor shall control the dust in all areas of the project, including staging yard and haul routes for the entire duration of the Contract. The Contractor shall have a water truck, sweeper and a roller on-site at all times with trained personnel to operate the equipment. Watering and/or sweeping the streets shall be required as conditions dictate, or as required by the Owner. The sweeping operation shall direct all materials towards the disturbed areas and not into residential yards. Should the Contractor fail to provide adequate dust control, the Owner reserves the right to stop work and/or refuse to process the Contractor's pay applications until the Contractor installs adequate dust control measures. No separate payment will be made for the control of dust.

G. MAINTENANCE STONE

The Contractor may utilize maintenance stone as authorized by the Project Coordinator. This stone shall consist of number 57 stone or similar aggregate. Aggregate Base Course (ABC) is not considered maintenance stone and shall not be paid for as such. This paragraph and the use of maintenance stone shall not supersede the Contract requirements of maintaining the project site.

Payment shall not be made for the installation of maintenance stone unless authorized and placed as directed by the Project Coordinator. Stone placed at the Contractor's convenience shall not be paid for.

H. STAGING AREAS

The Contractor shall be required to secure staging areas for storing materials, equipment, etc. All costs including, but not limited to, rent, restoration, site maintenance, erosion control measures and permit fees (including Temporary Use Permit required by the City of Fayetteville), shall be the responsibility of the Contractor. The Contractor will submit a Staging Area Operation Plan for each site consisting at a minimum of the following:

- The layout of each staging area clearly identifying use areas and sufficient in detail and scale to indicate the proximity of activity to adjacent residences and businesses;
- Transportation plan including routes for both ingress and egress;
- Dust control measures both on site and along transportation routes necessary to minimize the transmission of material onto streets used for ingress and egress; and,
- Hours of operation and noise mitigation measures.
- Application and Fee for the Temporary Use Permit.
- Application and Fee for Truck Route Permit.

The Contractor shall submit to PWC the application for the Temporary Use Permit, Truck Route Permit, and Staging Area Operation Plan. Upon acceptance by PWC, the applications shall be submitted to the City of Fayetteville by PWC for review and approval.

In an effort to minimize the inconvenience, if any, of a staging area to the neighborhood, the Owner shall have the right to reject the proposed location of any staging area where the proximity shall be near any prior or current annexation project related staging area and determines that the continued usage of the area will negatively impact the previously impacted neighborhood. The Contractor is responsible for complying with all applicable local, state, and federal regulations related to the operation of staging areas. All staging areas will be subject to inspection by the Owner, for compliance with this section without prior notice. If any violations are discovered the Owner will issue written notice of noncompliance to the Contractor in accordance with these Contract Documents. The Contractor shall address all deficiencies. Failure to do so will result in breach of contract.

Proper measures, to include total secondary containment, shall be used for fuel storage and to prevent spillage. The Contractor shall not stockpile materials or place fill dirt on any lot without approval from the property owner. Should the Contractor's stockpiles create drainage problems, the Contractor shall construct drainage improvements or relocate the stockpile as directed by the Owner, at the Contractor's expense.

The Contractor shall obtain a signed agreement for the staging area in accordance with the General Conditions of these Contract Documents. Upon the completion of the project the Contractor shall obtain a signed release from the property owner for the satisfactory completion and restoration prior to issuance of final payment. The Contractor shall obtain a signed agreement for the staging area in accordance with the General Conditions of these Contract Documents. Upon the completion of the project the Contractor shall obtain a signed release from the property owner for the satisfactory completion and restoration prior to issuance of final payment. The Contractor shall take all necessary measures to establish permanent groundcover on the staging area, prior to obtaining a signed release from the property owner. Restoration of the staging area and establishment of permanent ground cover shall be in accordance with the approved erosion control plan. All erosion control measures shall remain in place until the permanent ground cover is established. Restoration of the staging area shall be at the Contractor's sole expense, and shall not constitute additional compensation.

I. TRUCK ROUTE PERMIT

The Contractor will be required to obtain a Truck Route Permit from the City of Fayetteville and will be required to bond those City streets outside the project limits utilized for construction activities and/or deliveries. It is anticipated that the City will require a \$25,000 bond for the truck route permit. The cost of the bond shall be included in the Contractor's bid prices and shall not be paid for separately. The Truck Route Permit Application and fee shall be submitted to the Owner for forwarding to the City.

J. COLLATERAL DAMAGE

Collateral damage areas are locations where the Contractor's equipment, spoil piles, materials, etc., have disturbed lawns and other areas outside of their work. All collateral damage not in asphalt shall be sodded back at the Contractor's expense. Damaged trees shall be trimmed and treated with a tree dressing.

Any damage to asphalt during construction that is outside of the trench limits or has not been previously identified by the City of Fayetteville or the Project Engineer as failing shall

be considered collateral damage and patch paved in accordance with these Contract Documents at no cost to the Owner.

K. RIGHTS-OF-WAY AND/OR EASEMENTS

Deeds, grants, encroachment permits, and rights-of-way easements for necessary property will be secured by the Owner. Any additional access right-of-way shall be the responsibility of the Contractor. The Contractor shall be liable for all damages resulting from access usage.

If Work is delayed by reason of the inability of the Owner to promptly secure the necessary property or rights-of-way, the Contractor shall have no claim for loss due to such delays. The Contractor will be required to work in areas where easements have been secured and stopping work to move to various locations may be required. No payment shall be made for any mobilizations within the project limits. If the Project Engineer determines work cannot continue, the Contractor shall have no claim for loss due to such delays, but the time of completion may be extended accordingly.

The Contractor shall locate the limits of the rights-of-way, or property lines prior to beginning construction and shall not encroach beyond those limits. The Contractor shall be solely responsible for any damage to property resulting from failing to locate these limits prior to beginning construction.

If the Owner has not obtained all of the required easements at the time of advertisement, a list of those properties where an easement has not been obtained will be located in Volume I of these Contract Documents. The Contractor shall not enter those properties where easements are not obtained. Once the easements have been obtained, the Owner will notify the Contractor. Any special conditions resulting from the easement acquisition will be provided to the Contractor in writing. The Contractor shall comply with all easement special conditions.

L. NCDOT RIGHT-OF-WAY

The Contractor shall not begin work within any NCDOT rights-of-way until the Owner has obtained the necessary encroachment(s). Copies of the approved encroachments are contained within Volume I of these Contract Documents. The Contractor shall conform to all requirements of the approved NCDOT encroachment permit. Prior to any construction within NCDOT rights-of-way, the Contractor shall notify the District Engineer's Office in accordance with the approved encroachment. A copy of the approved encroachment agreement/permit shall be kept on the job site at all times and made readily available if requested. The NCDOT reserves the right to stop any work for noncompliance without claim for extra compensation.

All costs to comply with the terms of the approved NCDOT encroachment shall be the responsibility of the Contractor.

M. WASTE DISPOSAL

The Contractor shall be required to properly dispose of all unsuitable and excess material at no additional cost to the Owner.

N. EXCESS SUITABLE MATERIAL

The Contractor will be required to stockpile excess suitable material on an approved storage yard location. This stockpiled material shall be utilized as select backfill where needed within the project limits. The Contractor shall condition suitable material so that it may be utilized as select backfill within the project limits. Borrow material will only be utilized where suitable materials are not available from excavation within the project area and shall be authorized by the Project Coordinator. Excess material from the project, or staging yard, shall be hauled off and disposed of by the Contractor at his own expense. However, removal of suitable material which could have been utilized within the project limits shall be done at the Contractor's own risk. Payment for Borrow, or Select Material, will not be made for replacement of suitable material removed from the project limits or staging yard.

If suitable material is available in another project, the Owner will direct the Contractor to retrieve the material from the other project. Should the distance be within the free haul limit, no separate payment shall be made. Should the material be outside the free haul limit, payment shall be made at a per mile rate agreed upon between the Owner and the Contractor.

O. RESPONSIBILITY FOR MATERIAL

All pipe, fittings, manholes, and other materials shall be inspected upon arrival at the job site by a competent superintendent before unloading to insure that the quality of the materials conform to the specifications. All materials shall be subject to inspection by the Owner. Materials found to be defective shall be clearly marked and removed from the project.

P. WATER OUTAGES

The Contractor shall schedule a coordination meeting with the Project Coordinator and Project Engineer a minimum of three (3) working days prior to any proposed water outage. The coordination meeting shall be conducted prior to any notices being issued. The Contractor shall locate (vertically and horizontally) any utilities within the work area, in accordance with these Contract Documents. The locations of all utilities within the work area shall be determined prior to the coordination meeting. Any conflicts with the proposed work and the existing utilities shall be identified, and a plan for resolving the conflicts shall be presented to the Owner. The purpose of this coordination meeting is to ensure that the Contractor has a good understanding of the requirements related to the proposed outage, verify that there are no utility conflicts, discuss any necessary contingency plans, and all equipment, materials, tools, and all other incidentals necessary to complete the work are on the project site in good working order. Should, for any reason, the Owner deem that the Contractor is not prepared for the proposed outage, the outage notifications will not be distributed and the outage shall be postponed a minimum of two (2) weeks. The Owner will provide written notification to the Contractor of this decision. No additional contract time will be granted for this delay. Should the Contract time expire within that two (2) week period, the Owner reserves the right to assess liquidated damages, as outlined in these Contract Documents.

Once the water outage notifications have been issued, a follow-up coordination meeting with the Project Coordinator and Project Engineer shall be held a minimum of 24 hours prior to the scheduled outage. The purpose of this meeting is to verify that the Contractor

is prepared to proceed with the outage, and that all equipment, materials, tools, and all other incidentals necessary to complete the Work are on the project site and in good working order. If for any reason the Owner deems that the Contractor is not prepared, the outage shall be postponed and all customers immediately notified of the cancellation. The outage shall be postponed a minimum of two (2) weeks. No additional Contract time will be granted for this delay. Should the Contract time expire within that two (2) week period, the Owner reserves the right to assess liquidated damages, as outlined in these Contract Documents.

The Contractor shall complete the required work and restore water service within the given time period for the outage. Should the Contractor fail to complete the work within the allotted time, the Owner shall assess a penalty of \$500 per 15-minute interval or any portion thereof until water service is restored. This penalty will be deducted from the Contractor's pay application or be billed directly to the Contractor. The penalty may be waived for circumstances beyond the Contractor's control, as deemed by the Owner. The Project Coordinator and/or Project Engineer reserve the right to cancel or postpone the outage at any time, for any reason.

NOTE: THIS REQUIREMENT DOES NOT APPLY TO THOSE WATER MAINS OWNED BY AQUA AMERICA.

Q. DISPOSITION OF SURPLUS PROPERTY

All property which is surplus to the needs of the project will remain or become the property of the Contractor, unless otherwise stated in these Contract Documents. All property belonging to the Contractor shall be removed from the project by the Contractor prior to final acceptance.

R. CHEMICAL USES

All chemicals used during project construction or furnished for project operation, whether herbicides, pesticides, disinfectant, polymer, reactant or of other classification, must show approval of either the Environmental Protection Agency or the USDA. Use of all such chemical and disposal of residues shall be in strict conformance with manufacturer's instructions.

S. CONTRACTOR'S RESPONSIBILITY FOR WORK

Until final acceptance by the Owner, the project site and all the Work shall be the responsibility of the Contractor. The Contractor shall take every precaution to prevent damage to the project site, Work, and the surrounding areas. It shall be the responsibility of the Contractor to address any damage or injury arising from their direct or indirect performance on this project. The Contractor shall be responsible for maintaining the project site at all times and ensuring that the Work is installed and maintained in accordance with these Contract Documents until accepted by the Owner. This paragraph does not supersede the requirements of the general warranty.

2.06 PAYMENTS AND FINAL COMPLETION

A. STORED MATERIALS

The option to incorporate stored materials shall be addressed prior to the first pay estimate. The Contractor will not be permitted to request payment for stored materials on future pay applications once the first application has been signed by the Contractor and submitted to the Owner. If considered for payment, stored materials shall be delivered and stored to the satisfaction of the Project Coordinator. Stored material estimates must be submitted in a form acceptable to the Project Engineer. All invoices shall accompany the pay estimates and be separated by the associated project "Part" (i.e. Part A, Part B, etc.). Stored materials shall be paid for according to eighty-five percent (85%) of the actual invoice value including sales tax.

B. PAY ESTIMATES/PAY APPLICATIONS

All pay estimates will be generated by the Owner. The Contractor and the Project Coordinator will review quantities and mutually agree on the monthly quantities for payment. The monthly progress status report shall be signed by the Contractor and the Project Coordinator. Payment shall be based on those quantities installed and accepted as of the last Friday of the month. The Project Engineer will generate the pay application based on the quantities submitted and forward electronically the pay application to the Contractor to be returned with original signatures. The Contractor shall return all two (2) pay applications with sales tax certification and invoices, stored material documentation, certified payrolls for the period and Affidavit E. Pay requests will not be processed if any of the required documents have not been submitted.

C. PAYMENTS WITHHELD

The Project Engineer may refuse to approve the whole or any part of any payment. The Project Engineer may refuse to approve payment if evidence is discovered, or the results of subsequent inspection or tests, nullify any such payment previously approved. The Project Engineer reserves the right to withhold payment or any portion of a payment throughout the course of the project in the event the following, including but not limited to, occurs:

1. Slippage in the schedule in excess of two (2) or more weeks.
2. Liens or claims filed against the Contractor.
3. Persistent failure to carry out the work in accordance with the Contract Documents.
4. Claims from residents or businesses not addressed or resolved within thirty (30) days.
5. Defective work not corrected, tested, or completed following damage, correction or replacement.
6. Reasonable evidence that the Work cannot be completed for the unpaid balance of the Contract.
7. Reasonable evidence that the Work will not be completed within the Contract time and that the unpaid balance would not be adequate to cover actual or liquidated damages for the anticipated delay.
8. Damage to the Owner's property, Property Owner, or another Contractor.
9. The Contract price has been reduced because of modifications.
10. Any required documentation has not been submitted as requested.

The amounts withheld will be at the sole discretion of the Project Engineer. When the grounds for withholding payments have been removed, payment will be released. The

Project Engineer is not liable and will not accept claims from the Contractor resulting from payments being withheld.

D. CHANGE ORDERS

The Owner may authorize changes to the Work. These changes shall not invalidate, relieve, or release the Contractor from any guarantee given by him pertinent to the Contract provisions. These changes shall not affect the validity of the Payment Bond and Performance Bond nor relieve the Surety or Sureties of said Bonds. The Contractor shall notify their Bonding Company of all changes to the Contract. All changes to the Work shall be performed under the terms of the original Contract, unless otherwise specified in the approved Change Order.

Except in an emergency endangering life or property, no changes shall be made to the Contract without written notice from the Project Engineer authorizing such change. No claim for adjustments of the contract price shall be valid without such written authorization.

E. EXTENSION OF CONTRACT TIME

The Contract Time may be extended by change order for causes beyond the Contractor's control or for delays which the Project Engineer determines to be justified. Extensions to the Contract time shall be granted solely in calendar days. If, at the end of the Contract, the final completion date falls on a non-work day, the Project Engineer may, at their sole discretion grant additional calendar days so that the final completion date is the following work day.

Request for time extensions shall be made in writing within thirty (30) calendar days following the cause of delay. In cases of continuing cause for delay, only one claim is necessary. Failure to make written requests within the allowed time frame shall waive the Contractor's ability to make future claims for that specific instance.

Time can only be extended for the following:

- Change in Work Delays

Additional calendar days may be granted by the Project Engineer, for work assigned to the Contractor; through a change order, provided that the Contractor's critical path is impacted by the change in work. The additional time shall be based on the actual number of calendar days that the critical path (i.e. controlling operation) is delayed. The Project Engineer may extend the contract duration based on estimated calendar days to complete the additional work that does not impact the critical path.

- Weather Delays

The initial contract duration does not include weather days. Weather delays are defined as any event that affects the standard daily production for 50% or more of the Contractor's scheduled work day. Weather days shall be based on the actual precipitation received (i.e., inches of rain), the time the precipitation occurred, and the Project Coordinator's observations. Weather days shall not be granted for weather that occurs during non-working hours, including weekends and/or holidays, unless it affects the Contractor's standard daily production for 50% or

more of the following working days. If it is confirmed that the weather has affected production on the project, the Project Engineer will issue a modification of the contract time in full calendar days. Weather days shall be approved or disapproved by the Project Engineer based upon review of the project daily records.

Throughout the Contract, the Contractor shall record the occurrence of weather and the resulting impact to the scheduled work. It is the Contractor's responsibility to request additional time for weather delays in accordance with these Contract Documents. Requests for time extensions for weather delays do not entitle the Contractor to extend overhead.

F. WEIGH/QUANTITY TICKETS

Weigh/quantity tickets shall be required for those Contract quantities that are not measured in place. Work of this nature requires the Project Coordinator's approval prior to beginning or the Owner reserves the right not to pay for unauthorized work.

All weigh/quantity tickets for items not measurable in place shall be submitted to the Project Coordinator. Each ticket shall indicate the date, Contractor, job location, name of project, quantity of material, truck number and signature of the Contractor. The Contractor shall furnish a "certified scale ticket" with each load of material to the Project Coordinator by 5:00 pm the following business day in order to be considered for payment. Tickets shall not be accepted after that time.

When a material is to be paid for on a per ton basis, the weighing devices shall be certified by the N.C. Department of Agriculture. All scales shall be operated by a public weigh master licensed in accordance with the North Carolina General Statutes. A certified weigh certificate shall be issued for each load and contain the following information:

1. Project
2. Date
3. Time issued
4. Type of material
5. Gross weight (tons)
6. Tare weight
7. Net weight of material
8. Quarry or plant location
9. Truck number
10. Contractor's name
11. Public Weigh Master's stamp or number
12. Public Weigh Master's signature or initials in ink

The Project Engineer and/or the Project Coordinator may direct the Contractor to re-weigh the contents of any truck load that is delivered to the project on approved platform scales at no additional cost to the Owner.

When material is to be paid for on per cubic yard basis, the payment shall be based on 75% of the volume listed on the weigh/quantity ticket.

G. WATER AND SEWER MAIN

PREPARATION OF SYSTEMS FOR OPERATION

- Upon completion of the project, prior to the Contractor de-mobilizing and before final payment, the Contractor shall provide the following:

Sewer Work:

- Place a green paint mark at the curb, indicating the location of the lateral. The paint shall be heavily applied, so that the paint will last. The Contractor shall maintain and/or re-mark the locations as directed by the Owner until the project is accepted.
- Install a 48 inch tall stake at all cleanout locations in easements. The stake shall be a minimum of 36 inches above ground. The stake shall be painted green.
- Manholes located outside of pavement must have a PWC issued marker.
- All manholes having cam-lock ring and covers shall be locked.
- Install a PWC issued marker at all valve and air release valves at manholes outside of pavement as directed by Project Coordinator.
- Verify all valves associated with an installed lift station are open.
- Verify all plugs have been removed.

Water Work:

- Verify all valves are fully open.
- Verify all valves are accessible and can be operated.
- Place a blue paint mark at the curb, indicating location of the lateral. The paint shall be heavily applied so that the paint will last. The Contractor shall maintain and/or re-mark the locations as directed by the Owner until the project is accepted.

NO SEPARATE PAYMENT SHALL BE MADE FOR THIS WORK.

I. FINAL COMPLETION DOCUMENTATION

Prior to receiving final payment, the Contractor shall complete and/or provide the following:

- 1) Complete all punch list items to the satisfaction of the Project Engineer.
- 2) Satisfactorily resolve all customer complaints and obtain the required releases.
- 3) Provide project record drawings, in accordance with Submittals Section 01300; and
- 4) Provide project close-out submittals in accordance with Submittals Section 01300.

02110 - SITE CLEARING

SCOPE

Work described in this section includes clearing and grubbing site, protecting adjoining property and trees as indicated on the drawings or as specified herein. The work shall include the complete removal and satisfactory disposal of all growth including trees, stumps, logs and roots; organic material, and other debris or items that interfere with construction operations. The site clearing operations shall be conducted in a manner to insure minimum interference with roads, streets, walks, and other adjacent occupied or used facilities.

PROTECTION OF TREES AND VEGETATION

Trees and vegetation to be left standing shall be protected from damage incidental to clearing, grubbing, and construction operations, by the erection of timber barriers or by such other approved means. Such barriers must be placed and approved by the Engineer before construction operations can proceed. The protection shall include unnecessary cutting, breaking or skinning of roots; skinning and bruising of bark; smothering of trees by stockpiling construction materials or excavated material within the drip lines; excessive foot and vehicular traffic including parking of vehicles within drip line. Trees and vegetation receiving damage shall be repaired or replaced in a manner acceptable to the Engineer.

Trees designated to be left standing within the cleared areas shall be trimmed of dead branches 1½ inches or more in diameter and shall be trimmed of live branches to such heights and such manner as directed. Limbs and branches to be trimmed shall be neatly cut close to the hole of the tree or main branch. Cuts more than 1½ inches in diameter thus made shall be painted with an approved tree wound paint.

CLEARING AND GRUBBING

Clearing shall consist of the felling, trimming and cutting of trees into sections, and the satisfactory disposal of the trees and other vegetation designated for removal, including down timber, snags, brush, and rubbish occurring within the areas to be cleared. Trees, stumps, roots, brush, and other vegetation in areas to be cleared shall be cut off flush with or below the original ground surface except such trees and vegetation as may be indicated or directed to be left standing. Clearing operations shall be conducted so as to prevent damage by falling trees to trees left standing, to existing structures and installations and to those under construction, and so as to provide for the safety of employees and others.

Grubbing shall consist of the removal and disposal of stumps, roots larger than 3 inches in diameter, and matted roots from the designated grubbing areas. This material, together with logs and other organic or metallic debris not suitable shall be excavated and removed to a depth of not less than 3 feet below any subgrade shoulder and slope surfaces in excavated areas indicated to be grubbed and in areas indicated as construction areas under this contract such as areas for buildings, roads, streets, shoulder areas, sidewalks. Depressions made by grubbing shall be filled with suitable material compacted to make the surface conform to the original adjacent surface of the ground. The required fill material will not be measured or paid for but should be included as part of the grubbing cost. Grubbing inside the drip line of trees to be left standing shall be by hand methods.

The combined item of clearing and grubbing shall also include the removal and satisfactory disposal of fences, steps, walls, building foundations, pavement, other rubble and debris.

DISPOSAL

All timber, logs, stumps, roots, brush, rotten wood, and other debris from the clearing and grubbing operations shall be disposed of off-site in an approved disposal pit. Such approval will include the conditions covering the disposal of such logs and stumps without burning, including the disposal area off-site. The contractor will be responsible for compliance with all state and local laws and regulations. Burning of timber and other refuse is not allowed within the City of Fayetteville.

*** END OF SECTION ***

**DIVISION 2
SITE WORK
02211 - GRADING FOR ROADS AND DRAINAGE**

GENERAL

This section covers grading for the roadways and drives including all excavations, formation of embankments, preparation of subgrade for pavements and finishing and dressing of graded earth areas, shoulders, and ditches.

MATERIALS

Topsoil, material obtained from excavation suitable for topsoils, is defined as natural, friable soil, characteristics of representative soils in the vicinity that produce heavy growth of crops, grass, or other vegetation. Topsoil shall be free from roots, stones, and other materials that hinder grading, planting, and maintenance operations, and free from objectionable weed seeds.

Satisfactory soil materials are defined as those in accordance with AASHTO Soil Classification Groups, A-1, A-2-4, A-2-5 and A-3 (or in accordance with ASTM D2487 soil classification groups GW, GP, GM, SM, SW, SP, SC.) as determined by the Engineer. Satisfactory material shall be free from roots, organic matter, trash, debris, frozen material or stones larger than three (3) inches in any dimension.

Unsatisfactory soil materials are defined as those in accordance with AASHTO Soil Classification Groups A-2-6, A-2-7, A-4, A-5, A-6, A-7 (or in accordance with ASTM D2487 soil classification groups GC, ML, MH, CL, CH, OL, OH, and PT) as determined by the Engineer.

Materials determined by the Engineer as too wet or too soft to provide a stable subgrade, foundation, or fill will be classified as unsatisfactory regardless of soil classification. The Engineer may require the Contractor to condition the wet and/or soft soils to provide a stable subgrade, foundation, or fill. The Contractor shall recondition the materials at no additional cost to the Owner.

CONSERVATION OF TOPSOIL

Areas designated for operations that contain a blanket of soil, which is more satisfactory for the growth of grass than the embankment material to be placed, shall be stripped to a depth of approximately four (4) to six (6) inches and placed in convenient stockpiles as directed in the field, for later use as a topsoil blanket on the new graded areas specified herein, or as designated. The stripping of material for use as topsoil shall be carefully determined and only the quantity required shall be stripped and stockpiled. Material ordered stockpiled shall be placed in a satisfactory manner to afford drainage. When grading operations permit, instead of stockpiling, the topsoil shall be hauled and spread directly on the areas to receive topsoil.

Topsoil shall be placed on all shoulders, slopes, ditches, and other earth areas graded under this contract, excluding borrow areas, unless otherwise specified on the plans. Topsoil shall be uniformly placed on these areas to a compacted depth of not less than three (3) inches or more than four (4) inches. The material shall be free from clods of soil, matted roots greater than ½ inch in diameter, and any other objectionable material which might hinder subsequent grass and

mowing operations. The material shall be placed, leveled, and lightly compacted with at least one pass of a cultipacker, or other approved equipment weighing 100 to 160 pounds per linear foot of roller, to required cross sections, but shall be left one-tenth of a foot below the finished earth grade as specified in the paragraph FINISHED EXCAVATION.

BORROW EXCAVATION (Select Backfill)

Where satisfactory materials are not available in sufficient quantities from the required excavation, approved materials shall be obtained from borrow areas. Borrow excavation material shall be supplied by the Contractor from borrow areas located off-site. The work covered by this section shall consist of the excavation of approved material from borrow sources and the hauling and utilization of such material as required on the plans or directed by the Engineer. The borrow material shall be approved by the Engineer and shall not contain roots, root mats, stumps, highly plastic clay or other unsatisfactory materials. The material shall be a soil material which meets requirements of AASHTO M1 45 for soil classification A-i-a, A-i-b, A-2-A, A-3 acceptable for select backfill. All borrow material shall be in accordance with the NCDOT Standard Specification for Roads and Structures, most recent edition. Borrow excavation shall be in accordance with the NCDOT Standard Specification for Roads and Structures, most recent edition. Excess material removed within the work limits, suitable for borrow excavation, during "Unclassified Excavation" operations shall not be considered or paid for as borrow excavation.

UNDERCUT EXCAVATION

When the Owner determines that the natural soil materials in areas where fill is to be placed, or in the finished graded subgrade roadway cross section, or in areas supporting structures or pipes, are determined to have a poor supporting value, the Engineer may require the Contractor to remove the materials and backfill with approved properly compacted material to the finished graded section. The Contractor shall conduct undercut operations in such a way that the Engineer can take the necessary measurements before any backfill is placed. Any material removed and backfilled without the approval of the Engineer, and/or all necessary measurements taken, and/or to a depth, length or width exceeding the dimensions shall not be considered undercut excavation and will not be paid for such. All undercut excavation shall be in accordance with the NCDOT Standard Specification for Roads and Structures, most recent edition. Undercut excavations suitable for backfill on toes of slopes and other approved areas will not be paid for as borrow excavation.

FINISHED EXCAVATION

All areas covered by the project, including excavated and filled sections and adjacent transition areas, shall be uniformly smooth-graded. The finished surface shall be reasonably smooth, compacted, and free from irregular surface changes. The degree of finish shall be that ordinarily obtainable from blade-grader operations, except as otherwise specified. Ditches shall be finished to permit adequate drainage. The surface of areas to be turfed shall be finished to a smoothness suitable for the application of turving materials. Surfaces shall be finished not more than 0.15 foot above or below the established grade and approved cross section. In areas where the bulking of soil as a result of grassing operations will tend to retard surface drainage along the edge of pavements, the finished grades shall be left 0.1 foot below grade prior to grassing. Newly graded areas shall be protected from traffic and from erosion, and any settlement or

washing away that may occur from any cause, prior to acceptance, shall be repaired and grades re-established to the required elevations and slopes. Embankments and excavations shall be kept shaped and drained. Ditches and drains along subgrade shall be maintained in such a manner as to drain effectively at all times. The finished subgrade shall not be disturbed by traffic of other operations and shall be protected and maintained by the Contractor in a satisfactory condition until subbase, base, or pavement is placed. The storage or stockpiling of materials on the finished subgrade shall not be permitted. No base course or pavement shall be laid until the subgrade has been checked and approved, and in no case shall base, surfacing, or pavement be placed on a muddy, spongy, or frozen subgrade. All work shall be conducted in accordance with the environmental protection requirements of the contract.

*** END OF SECTION ***

DIVISION 2
SITE WORK
02222 - EXCAVATION AND BACKFILLING FOR UTILITY SYSTEMS

GENERAL

Work described in this section consists of the excavation, backfill, compaction, and finish grading required to install the utility systems. The intent and purpose of these specifications is to require a complete and satisfactory installation in every respect and any defect in material or workmanship shall be cause for the replacement and correction of such defect as directed by the Public Works Commission.

RELATED SECTIONS

- A. 02305 – Pipe Bursting
- B. 02660 – Water Distribution
- C. 02730 – Sanitary Sewer Systems
- D. 02732 – Sewage Force Mains
- E. Chapter 24 of the City of Fayetteville Ordinance (most recent version)

MATERIALS

Suitable soil materials are defined as those in accordance with AASHTO Soil Classification Groups A-1, A-2-4, A-2-5 and A-3 (or in accordance with ASTM D2487 soil classification groups GW, GP, GM, SM, SW, SP, SC) as determined by the Public Works Commission. Suitable material shall be free from roots, organic matter, trash, debris, frozen material or stones larger than three (3) inches in any dimension.

Unsuitable soil materials are defined as those in accordance with AASHTO Soil Classification Groups A-2-6, A-2-7, A-4, A-5, A-6, A-7 (or in accordance with ASTM D2487 soil classification groups GC, ML, MH, CL, CH, OL, OH, and PT) as determined by the Public Works Commission. Unsuitable material as defined above shall be replaced with select material as determined by the Public Works Commission.

Suitable materials determined by the Public Works Commission as too wet or too soft to provide a stable subgrade, foundation, or fill will be deemed as unsuitable regardless of soil classification. Materials deemed unsuitable shall be conditioned or replaced, as directed by the Public Works Commission. The Contractor shall recondition and stockpile the materials at no additional cost to the Public Works Commission.

EXCAVATION

All excavation shall be to the lines and grades indicated. The work shall consist of the excavation, placement, and compaction of suitable material as outlined in this Specification and proper disposal of all unsuitable materials. During excavation, suitable material for backfilling shall be stockpiled. The stockpiles shall be protected from contamination by unsuitable excavated material or other material. If any material becomes unsuitable, such material, if directed, shall

be removed and replaced with suitable on-site or imported material from approved sources at no additional cost to the Public Works Commission.

Where the line parallels a creek and/or ditch the excavated material shall be stockpiled opposite the creek, with the trench separating the two. Adequate drainage shall be provided for the stockpiles and surrounding areas by means of ditches, dikes, or other approved methods. Grading shall be done to prevent surface water from entering the excavation. Any water within the trench shall be removed.

Suitable excavated material shall be stockpiled or placed in the excavation's backfill. Excavation and filling shall be performed in a manner and sequence that will provide drainage at all times. Unauthorized over excavation shall be backfilled with select bedding material at no additional cost to the Public Works Commission. The Contractor, at their expense, shall properly dispose of all excess excavated material unless directed to place it in another area of the project by the Public Works Commission. The Contractor's obligation to remove and dispose of excess materials shall in no manner convey to him any rights of property in any material taken from any excavation.

It shall be the Contractor's responsibility to investigate the site and existing conditions. No compensation will be allowed due to excavation and/or grading being different than anticipated.

TRENCH EXCAVATION

The trench width shall be in accordance with the PWC standard details. All work shall be in accordance with the applicable OSHA regulations.

The subgrade beneath the centerline of the pipe shall provide uniform support for each section of the pipe. Stones three (3) inches or greater in any dimension, or as recommended by the pipe manufacturer, whichever is smaller, shall be removed.

Where unsuitable material is encountered at the elevation established for installation of pipe or structures, additional undercut excavation shall be done as directed by the Public Works Commission. The additional undercut excavated area shall be backfilled with stone bedding material. Unauthorized undercut excavation shall be backfilled with stone bedding material and compacted as directed by the Public Works Commission. The Contractor shall conduct undercut operations in such a way that the Public Works Commission can take the necessary measurements before any backfill is placed. Any material removed and backfilled without the approval of the Public Works Commission, and/or all necessary measurements taken, and/or to a depth, length or width exceeding the dimensions shall not be considered undercut excavation and will not be paid for such.

Where unsuitable material is encountered at the elevation established for installation of roads, parking lots, or other paved areas, additional undercut excavation shall be done as directed by the responsible agency (i.e., City of Fayetteville, Town of Hope Mills, NCDOT, etc.). The additional undercut excavated area shall be backfilled with stone bedding material. Unauthorized undercut excavation shall be backfilled with stone bedding material and compacted as directed by the responsible agency. The Contractor shall conduct undercut operations in such a way that the responsible agency can take the necessary measurements before any backfill is placed. Any material removed and backfilled without the approval of the responsible agency, and/or all necessary measurements taken, and/or to a depth, length or width exceeding the dimensions

shall not be considered undercut excavation. All undercut excavation shall be in accordance with the NCDOT Standard Specification for Roads and Structures (most recent edition), or the responsible agency's specifications.

Excavation for manholes, meter vaults, or similar structures shall leave a minimum of 12-inches clear space around the structure. Removal of unsuitable material shall be as specified above. Preparation of the subgrade shall be in accordance with the applicable detail and as directed by the Public Works Commission.

PIPE LAYING

All pipe shall be installed in accordance with PWC Specification Section 02660 – Water Distribution, Specification Section 02730 – Sanitary Sewer Systems, and/or PWC Specification Section 02732 – Sewage Force Mains.

TRENCH SAFETY

All excavations shall comply with all Federal, State, and local rules and regulations. The Contractor shall have a trenching and shoring "competent" person on the job at all times when there is an open excavation. Under no circumstance shall an employee of the Public Works Commission be considered the "competent" person for the operation.

TRENCH STABILIZATION (SHORING)

The Contractor shall furnish, install, and maintain all necessary shoring to ensure a safe excavation. The method of shoring and excavation shall be in strict accordance with OSHA Regulations. The Contractor shall be responsible for installation, maintenance, and removal of all trench stabilization measures. The Contractor shall be responsible for any damage to adjacent structures resulting from the installation, maintenance, removal, or absence of trench stabilization measures.

DEWATERING

Excavations shall be kept dry at all times. Any required dewatering shall be the Contractor's responsibility. The Contractor shall be responsible for any damage to the adjacent property resulting from the installation, maintenance, discharge, and removal of the dewatering system. All discharge from the dewatering system shall be in accordance with the applicable erosion control rules and regulations.

BACKFILL

Backfill shall consist of suitable material free from debris, stone, etc. The backfill shall be brought up evenly on both sides of the pipe for the full length of the pipe. The backfill operation shall be conducted to prevent damage and/or movement of the pipe.

Backfill material in trenches shall be placed in layers not exceeding six (6) inches loose thickness to a point at least 12-inches above the pipe compacted to 90 percent maximum density. The remainder of the trench shall be backfilled in layers not exceeding six (6) inches in loose thickness

compacted as specified in subparagraph COMPACTION. Each layer shall be thoroughly compacted by an approved mechanical tamping device.

Backfill material around structures shall be placed in a manner that the structure will not be damaged. No backfill shall be placed around manholes, thrust blocks, or similar structures until the concrete has been allowed to cure for three (3) days. The backfill material shall be compacted as specified in subparagraph COMPACTION.

No backfilling will be allowed when weather conditions prevent compliance with these Specifications.

BORROW EXCAVATION (Select Backfill)

Borrow excavation material shall be supplied by the Contractor when sufficient quantities of suitable materials are not available within the project limits. The borrow material shall be approved by the Public Works Commission and shall not contain roots, root mats, stumps, highly plastic clay or other unsatisfactory materials. All borrow material shall be in accordance with the NCDOT Standard Specification for Roads and Structures, most recent edition.

COMPACTION

Backfill shall be compacted in accordance with the following table as a percentage of the maximum density at optimum moisture content as determined by the Standard Proctor Test, ASTM D-698.

<u>Area</u>	<u>Percent ASTM D-698 Maximum Dry Density</u>
Around and 1' above top of pipe	95
Remaining trench (within 4' of subgrade)	95
Pavement subgrade and shoulders	
Last 1' of fill (below subgrade)	100
Last 3' of fill to 12" below subgrade	98
Base material	100
Adjacent to structures (Areas not paved)	95
Under structures	98
Utility Outfalls (Cross Country)	95

Compaction testing may be performed at the option of the PWC Project Coordinator, or as required by the responsible agency (i.e., City of Fayetteville, NCDOT, etc.). Compaction testing shall be done in accordance with the responsible agency's requirements. Deficiencies shall be corrected by the Contractor without additional cost to PWC.

FINISHED EXCAVATION

All areas covered by the project shall be uniformly graded to the established elevations and approved cross sections. Ditches shall be graded to permit proper drainage. Newly graded areas shall be protected from traffic and/or from erosion, and any settlement or washing prior to acceptance shall be repaired and the required grades re-established. Ditches and drains along

the subgrade shall be maintained to drain at all times. The finished subgrade shall be protected and maintained by the Contractor. The storage or stockpiling of materials on the finished subgrade shall not be permitted. No base course or pavement shall be laid until the subgrade has been checked and approved. All work shall be conducted in accordance with the environmental protection requirements of the Contract.

*** END OF SECTION ***

**DIVISION 2
SITE WORK
02272 - EROSION CONTROL - GENERAL PROVISIONS**

GENERAL

The Contractor shall be responsible for conducting his site grading and drainage operations in such manner as to prevent or lessen excessive soil erosion of the construction site work areas. He shall at all times provide satisfactory means to prevent or minimize the movement and washing of large quantities of soil. The Contractor is expected to review his site grading and drainage operations periodically to determine the areas most susceptible to erosion by excessive rainfall and periodically maintain all installed measures for the project duration. The Contractor shall correct any deficiencies or problem areas as directed by the Owner or the North Carolina Department of Environment and Natural Resources (NCDENR) inspector within 48 hours.

EXECUTION

The Contractor's attention is directed to the fact that unless exposed earth areas are properly cared for during construction, they may result in substantial sedimentation damage downstream from the construction area. He shall at all times provide satisfactory means to prevent or minimize the movement and washing of quantities of soil onto pavements or into adjacent ditches, swales, inlets, and drainage pipes, to avoid the possibility of these structures becoming clogged with soil. Should this happen as a result of erosion at the site of this construction, the Contractor will be required to immediately provide means for removal of the soil and/or debris from the structures to restore the proper functioning of these structures. The Contractor shall assume all responsibilities to the affected property owners for correction of all damages. The Contractor is expected to review his site grading and drainage operations periodically with the Owner with the view in mind of determining the areas most susceptible to erosion by excessive rainfall and shall take necessary temporary measures in sufficient time to minimize the washing away of the site soils that would likely occur before the areas are finished graded, topsoiled and planted. The temporary measures to be provided by the Contractor at the critical areas may consist of, but not limited to, any one or a combination of the following, or by other approved means selected by the Contractor:

Silt Fence
Gravel Construction Entrance/Exit
Inlet Protection

If any earthwork is to be suspended for any reason whatsoever for longer than 15 days, the disturbed areas shall be seeded with temporary vegetative cover or otherwise protected against excessive erosion during the suspended period. Suspension of work in any area of operation does not relieve the Contractor of the responsibility for the erosion control and temporary measures will not be considered cause for a change in the price bid.

MAINTENANCE

The Contractor shall inspect and maintain each erosion control measure until the project is stabilized and accepted. After each significant rainfall, the Contractor shall remove and dispose

**ERROR! UNKNOWN DOCUMENT
PROPERTY NAME.**

Error! No text of specified style in document.

of silt accumulation from each individual measure. The following maintenance may be required for each specific erosion and sediment control measure:

Silt Fence: Fabric shall be removed and replaced whenever deteriorated to such an extent the effectiveness is reduced. The toe of the fabric shall be buried a minimum of 6 inches.

Gravel Construction

Entrance/Exit: Periodic top dressing with two inches (2") of graded stone. Remove all objectionable materials spilled, washed or tracked onto public roadways.

Sediment

Trap: Remove sediment and restore trap to original dimensions when accumulated silt volume equals $\frac{1}{2}$ the design depth. Replace the contaminated gravel facing.

Gravel Inlet

Protection: Remove sediment as necessary to provide adequate volume. Replace contaminated gravel facing if required.

Rip-Rap: Make repairs to dislodged stone and/or supplement as required if erosion occurs during heavy rainfalls.

REMOVAL

After the area has been stabilized and the project accepted, the Contractor shall remove all temporary erosion and sediment control measures. Silt fences shall be removed, sediment traps/pits and/or basins filled with suitable soil, compacted and seeded. The materials removed shall remain the property of the Contractor and shall be disposed of off-site, or may be reused in other locations if approved by the Owner.

*** END OF SECTION ***

**DIVISION 2
SITE WORK
02273 - TEMPORARY SILT FENCE**

GENERAL

The work covered by this section consists of furnishing, installing, maintaining and removing a water permeable filter type silt fence for the purpose of removing suspended particles from the water passing through it.

The quantity of temporary silt fence to be installed will be affected by the actual conditions which occur during the construction of the project. The quantity of temporary silt fence may be increased, decreased, or eliminated entirely at the direction of the Owner. Such variations in quantity will not be considered as alterations in the details of construction or a change in the character of the work.

MATERIALS

Either wood posts or steel posts may be used. Wood posts shall be a minimum of 6 feet long, at least 3 inches in diameter, and straight enough to provide a fence without noticeable misalignment. Steel posts shall be 5 feet long, 1 3/4 inches wide and have projections for fastening the wire to the fence.

Wire fence fabric shall be at least 32 inches high, and shall have at least 6 horizontal wires. Vertical wires shall be spaced 12 inches apart. The top and bottom wires shall be at least 10 gage. All other wires shall be at least 12½ gage.

Burlap shall be at least 36 inches wide and shall weigh at least 6.7 ounces per square yard. Other materials may be used in lieu of burlap, provided those materials have been approved by the North Carolina Department of Environment and Natural Resources (NCDENR).

Wire staples shall be No. 9 staple and shall be at least 1½ inches long.

INSTALLATION

The Contractor shall install a temporary silt fence as shown on the plans and details. The silt fence shall be constructed at the locations shown on the plans and at other locations directed by the Owner.

Posts shall be installed so that no more than 3 feet of the post shall protrude above the ground and at least 18 inches are driven into the ground. Filter fabric shall be attached to the wire fence fabric by wire or other acceptable means. The fabric shall be continual in length. The fabric shall extend into a 6"x 6" trench along the uphill side of the fence. The trench shall be backfilled and compacted. Place 6 inches of No. 57 stone along the toe of the fence to secure the fabric in place. The single stripe located approximately 6 inches from the silt fence outer edge should not be visible if the fabric and fencing are installed properly.

*** END OF SECTION ***

**DIVISION 2
SITE WORK
02274 - GRAVEL CONSTRUCTION ENTRANCE/EXIT**

GENERAL

The work covered by this section consists of furnishing, installing, maintaining and removing temporary gravel construction entrance/exits. The entrance/exit shall be located at points where vehicles enter and exit the project and as indicated on the plans to limit sediment "tracked" off the site.

Where there are differences or conflict between this specification and those requirements outlined in an approved Erosion Control Plan, the specifications in the erosion control plan shall take precedence

MATERIALS

The stone shall be two inch (2") to three inch (3") washed stone.

INSTALLATION

The Contractor shall install the gravel construction entrance as shown on the plans and details. The construction entrance shall be constructed at the locations shown on the plans and at other locations directed by the Engineer.

The area to receive the stone shall be cleared of all vegetation, roots and other objectionable materials. The subgrade shall be graded and properly compacted. Areas yielding shall be covered with engineering fabric or undercut as directed by the Engineer. The stone shall be placed, graded and compacted to a minimum depth of eight inches (8") and as shown on the plans. The minimum construction entrance dimensions shall be 50 feet in length and 12 feet in width. The construction entrance/exit shall be maintained and the stone supplemented throughout the life of the project and shall be removed upon stabilization and disposed of off-site at the Contractor's expense.

*** END OF SECTION ***

**DIVISION 2
SITE WORK
02275 - BLOCK AND GRAVEL INLET PROTECTION**

GENERAL

The Contractor shall install block and gravel inlet protection when storm drain inlets are to be made operational before permanent stabilization of the disturbed drainage area. The inlet protection applies to areas of heavy runoff and provides for overflow capacity to prevent excessive ponding; however, shallow temporary flooding should be anticipated.

INSTALLATION

The Contractor shall install the block and gravel inlet protection as shown on the detail drawing and at the locations indicated. As an option, the concrete blocks may be omitted and the entire structure made of gravel and stone. A structure made entirely of stone is commonly called a "gravel doughnut". In this case, keep the stone slope toward the inlet at 3:1 or flatter. Stone shall be washed stone with a minimum 3 inch size on the basin side for stability and 1 inch or smaller (No. 57) on the flow side.

*** END OF SECTION ***

**DIVISION 2
SITE WORK
02301 - BORING AND JACKING**

GENERAL

Installation shall be by dry boring and jacking of a smooth wall steel pipe that is true to line and grade under roadways or where indicated on the plans, all in accordance with these specifications and recommendations of the pipe manufacturer. The Contractor shall notify the Public Works Commission's Project Coordinator a minimum of seven (7) days prior to any contemplated work. All required permits and approvals shall be secured prior to commencing work.

MATERIALS

Materials to be used shall be appropriate for the installation method chosen by the contractor. All materials shall be submitted to the Public Works Commission for approval, prior to the Contractor commencing operations.

Dry Boring & Jacking

The casing pipe shall be spiral welded or smooth wall steel pipe in accordance with ASTM A53, Grade B having minimum yield strength of 35,000 psi. The carrier pipe installed for water or force main applications, within the casing pipe shall be CL 50 ductile iron restrained joint pipe. Use of pressure class ductile iron pipe for water mains is acceptable, in accordance with Specification Section 02660. Mechanical joint restraint systems (i.e., Mega-Lugs, grip-rings, field-lok gaskets, etc.) are not an acceptable means of restraint within the casing pipe for water mains or force mains.

The material for the gravity sanitary sewer carrier pipe shall be CL 50 ductile iron restrained joint pipe. All carrier pipes in sewer service shall have the appropriate lining and coating. Use of restraining gaskets (i.e., field-lok gaskets) is an acceptable means of restraint for gravity sewer mains. Use of mega-lugs (or equivalent) is not approved for restraint within casings.

The casing pipe minimum size and minimum wall thickness shall be in accordance with the following chart unless indicated otherwise on the drawings.

CARRIER PIPE (dia, in inches)	MIN CASING SIZE (inches)	WALL THICKNESS (inches)	RAILROAD WALL THICKNESS (inches)
4	10	0.188	0.188
6	12	0.250	0.281
8	16	0.250	0.281
12	24	0.250	0.375

16	30	0.312	0.469
18	30	0.312	0.469
24	36	0.375	0.532
30	42	0.500	0.625
36	48	0.500	0.688

The Contractor may substitute larger size casing pipe (particularly for sewer mains where grade and alignment are critical) with the proper wall thickness. A manual steering head or other approved guidance system is recommended for casing pipe 30 inches and larger and/or bores exceeding 100 feet in length.

INSTALLATION

Installation using the selected method shall be true to line and grade, where indicated on the plans, all in accordance with these specifications and recommendations of the pipe manufacturer. The Contractor shall notify all affected parties a minimum of seven (7) days prior to any contemplated work.

It is recommended that the Contractor perform each bore before beginning the sewer line construction. The boring shall be performed from the "upstream" to "downstream" direction maintaining the critical downstream invert elevation. Should the bore termination not be on grade, a revised plan shall be submitted to PWC Water Resources Engineering for approval. No additional payment shall be made for any required corrective actions. The boring operations shall be conducted at all times in such a manner so as not to create a hazard to nor impede the flow of traffic.

The Contractor will be responsible for any repair costs if any settlement or damage to the roadway or railroad bed resulting from the boring operation occurs within one year after completion of the work. The Contractor shall maintain proper insurance as required by the permitting agency.

The Contractor shall submit all requested information as required by the permitting agency.

Dry Boring & Jacking

The alignment and grade of the jacking shall be carefully established prior to beginning the operation. A licensed professional land surveyor shall provide staking to establish the correct alignment and grade. The licensed surveyor (or a licensed professional engineer) shall provide cut sheets to the Public Works Commission and the contractor.

Lubricants such as bentonite may be applied to the outside of the pipe to reduce frictional resistance during jacking. The boring auger shall not be a greater diameter than the outside diameter of the encasement and removal of the excavated material ahead of the pipe will be held to a minimum to prevent the formation of voids.

Voids occurring outside the encasement pipe shall be filled with 1:3 Portland cement grout and the ends of the encasement pipe closed with masonry after the carrier pipe placement. The voids shall be filled with 1:3 Portland cement grout at sufficient pressure to prevent settlement of the roadway or railroad. The method of grouting shall be as approved by the permitting agency.

If the installed casing is deemed to be unusable by the Public Works Commission and/or the permitting agency, the casing shall be abandoned by bricking each end and filling the casing with grout, or as directed by the permitting agency.

The Contractor shall locate all existing utilities in the proposed location of the jack and bore. Design of the casing shall be in accordance with PWC standards, and subject to PWC approval. The casing should have a minimum separation of 12-inches from existing utilities.

In the event two parallel casings are being installed, the minimum separation between the outside edges of each casing shall be five (5) feet, or as directed by the permitting agency. In the event of a conflict between this specification and the permitting agency's requirements, the more stringent shall apply.

The use of "back-taps" is not encouraged. The design engineer shall take all necessary steps to determine the location of existing utilities and evaluate the necessity of a back-tap. Should it be necessary to install a back-tap, the top of casing shall be a minimum of 12-inches below the bottom of the pipe to be tapped. All pipe and fittings from the tap location to the carrier pipe shall be restrained joint. Use of mechanical joint restraint systems (i.e., mega-lugs, grip-rings, etc) are allowed in such instances. The Public Works Commission shall review and approve all proposed back-tap locations.

*** END OF SECTION ***

**DIVISION 2
SITE WORK
02302 - HORIZONTAL DIRECTIONAL DRILLING**

GENERAL

The Contractor shall furnish all labor, equipment, materials, and incidentals necessary for the construction of a new potable water main by horizontal directional drilling as shown on the Contract Drawings and as specified herein. Horizontal Directional Drilling (HDD) is a method of trenchless pipe installation using a steerable drilling operation which directly installs a pipe along an alignment without a conventional open cut or open face. HDD operations shall be completed so as not to interfere or endanger surface activity. The Contractor shall furnish all labor, materials, equipment, and incidentals necessary to install the potable water main utilizing HDD.

RELATED SECTIONS

- A. Section 02222 – Excavation, Trenching and Backfilling for Utility Systems
- B. Section 02272 – Erosion Control – General Provisions
- C. Section 02500 – Traffic Control
- D. Section 02660 – Water Distribution
- E. Section 02737 – Ductile Iron Pipe for Horizontal Directional Drilling

Additionally, the Contractor shall be familiar with the “Horizontal Directional Drilling Good Practices Guidelines” (latest edition), as prepared by the HDD Consortium.

PROJECT/SITE REQUIREMENTS

- A. The Contractor is encouraged to perform his own subsurface investigation as they deem necessary to understand the full extent of the drilling conditions and requirements.
- B. HDD operations shall limit vibrations transmitted to surrounding structures so as not to cause damage.
- C. Contractor shall complete a pre-construction survey and video of the existing conditions of the entire site and 50 feet either side of the proposed alignment prior to commencing construction activities.
- D. All disturbed areas shall be restored in accordance with these Contract Documents.
- E. All HDD work within the rights-of-way of the North Carolina Department of Transportation (NCDOT) shall be subject to the requirements of NCDOT, as outlined in the approved encroachment.

MATERIALS AND EQUIPMENT

- A. Pipe shall be flexible restrained joint pipe in accordance with specification Section 02737 – Ductile Iron Pipe for Horizontal Directional Drilling.
- B. Fittings shall be of working pressure rating equal to or greater of the pipe to be joined. All fittings shall be in accordance with specification Section 02660 – Water Distribution.
- C. Two (2) continuous detection wires shall be installed with any plastic pipe installed with HDD. The detection wire shall be minimum 12 gauge single strand, coated copper or copper clad steel wire that is suitable for underground use. There shall be no splices

- within the length of pipe installed via directional drill. The detection wire shall be firmly secured to the pipe throughout the installation process. The detection wire shall be installed in accordance with PWC requirements.
- D. The lubricant shall be bentonite or polymer based slurry. The proposed drilling fluid shall be specified based on the geotechnical reports(s) and the Contractor's evaluation of the site conditions. The fluid manufacturer shall be on-site for the first batch preparation. The fluid manufacturer should prepare and provide the fluid management plan.
- a. The drilling fluids shall be mixed in accordance with the manufacturer's recommendations and be appropriate for the anticipated soil conditions. No hazardous additives may be used.
 - b. The drilling fluid delivery system shall be leak free and have sufficient capacity for the length and diameter of the bore and soil conditions, to maintain borehole stability and reduce drag.
 - c. All drill fluids shall be captured, disposed, or recycled in a manner to prevent environmental degradation.
- E. The drill rig and associated equipment shall be in good condition and capable of completing the project without significant delays. Drilling equipment shall be capable of a minimum of 150% of the anticipated drilling forces. The Contractor shall be required to have access to a backup drilling rig of similar or greater pulling capacity. The drilling rig must:
- a. Be grounded during operation
 - b. Be securely anchored to withstand operating forces
 - c. Maintain a leak free hydraulic powered system that is self-contained with sufficient pressure and volume to power the drilling operation for all HDD activities.
 - d. Include a guidance system operated by trained personnel who are aware of any magnetic or electromagnetic anomalies, and must consider such anomalies in the operation of the guidance system.
 - e. Include a steerable drill head compatible with the soil conditions encountered.
 - f. Include a system to monitor and record maximum pullback pressure during pullback operations.

INSTALLATION

Though the installation process may be licensed or proprietary in nature, the Contractor shall not change any material, thickness, design, values or procedural matters stated in the submittals, without the prior knowledge and approval of the Public Works Commission. The Contractor shall submit, in writing, full details about component materials, their properties and installation procedures and abide by them fully during the entire course of the work.

The Contractor shall take all necessary measures to ensure the specified directional drill pipe is not damaged beyond the manufacturer's specified tolerances during delivery, storage, or installation. All piping materials shall be stored off of the ground and the proper measures shall be taken to protect the specified directional drill pipe from sunlight (as appropriate). Any gouges or damage to the specified directional drill pipe beyond the manufacturer's tolerances will result in the pipe or section of the pipe, being rejected and replaced with undamaged pipe at no additional cost to the Public Works Commission. Installation guidelines from the pipe supplier shall be followed for all installations. Pipe shall not be installed in a manner that exceeds the recommended bending radius and safe pulling force.

The Contractor shall provide equipment to guard against electrocution and an alarm system on drilling equipment capable of detecting electrical current as it approaches electric lines. The Contractor shall maintain safe conditions and prevent damage at all times.

All excavations shall conform to OSHA requirements. Locations of the entry and exit pits shall be approved by the Public Works Commission prior to beginning construction. The site should be graded or filled to provide a level working area for the HDD rig. Excavating and backfilling entry and exit points shall be in accordance with local conditions and the Contract Documents. Site restoration shall be in accordance with the Contract Documents.

All existing utilities shall be located and protected as necessary. The Contractor shall coordinate any utility protection with the respective utility company. Utility coordination and protection shall be in accordance with these Contract Documents.

The Contractor shall transport and dispose of all waste soils, slurries and other wastes in accordance with applicable regulations at no additional cost to the Public Works Commission. Drilling fluids should be minimized at locations other than entry and exit points. The Contractor shall immediately clean up any drilling fluids that inadvertently surface (i.e., fracouts) in accordance with the approved work plan. No waste shall be left on-site following completion of the work. The Contractor shall dispose of all groundwater generated by dewatering operations and any surface water entering access pits in accordance with applicable regulations and these Contract Documents.

Prior to beginning HDD operations, the wireline tracking shall be installed and calibrated in accordance with the manufacturer's recommendations. In addition, the Contractor shall walk the project site to identify any objects that may interfere with the drilling operations, the proper operation of the receiver and transmitter, and/or pose any other concern with regards to the installation.

Horizontal Directional Drill Operations

The Contractor shall notify the Public Works Commission a minimum of five (5) business days before commencement of work. At least one of the Contractor's field supervisors listed in the work plan shall be at the site at all times when HDD operations are in progress. The Contractor shall maintain operations 24 hours a day, seven days a week during drilling and pullback.

A protective bumper or roller shall be utilized to prevent the pipe from being dragged along the ground, damaged during the pullback operation and to reduce the pullback forces.

The Contractor shall follow the pipeline alignment shown on the Contract Drawings and the tolerances specified herein:

- A. Vertical alignment plus or minus 0.5 foot. Vertical path of the pilot hole shall not establish new high points not shown on the drawings.
- B. Horizontal alignment plus or minus 1.5 foot.
- C. Include electronic monitoring of horizontal and vertical drilling head location. Obtain accuracy range within 1 inch of actual position of pipeline. Record position readings at maximum of 10 foot intervals.

At completion of pilot hole drilling, the Contractor shall furnish the Public Works Commission tabulations of horizontal and vertical alignment. Any adjustments to the pipeline alignment shall be approved by the Public Works Commission before implementation.

The Contractor shall maintain close observation to detect settlement or displacement of surface and adjacent facilities, as well as frac-outs. The Public Works Commission shall be notified immediately if settlement, displacement, or frac-out is detected. The Contractor shall immediately respond to a frac-out and take all necessary measures to control and contain the drilling fluid. The Contractor shall take complete responsibility for all costs related to the clean-up of the frac-out, and shall fully cooperate with the Public Works Commission in responding to and cleaning up the drilling fluid. The Contractor shall have the necessary materials and personnel to respond to a frac-out or other emergency.

The Contractor shall ream the pilot hole to a diameter which is sufficiently sized to reduce forces applied to the pipe during pull back. Table 1 provides recommendations for reamed diameter, based on pipe diameter. Final ream diameters less than 1.5 times the pipe O.D. must be approved by the Public Works Commission prior to initiating pullback.

Table 1. Pipe Diameter and Recommended Ream Diameter

Pipe Diameter	Recommended Ream Diameter
less than 8"	pipe diameter + 4"
8" through 24"	1.5 times pipe diameter
greater than 24"	pipe diameter + 12"

Pipe Installation

The Contractor shall install a swivel between the reamer and pipe connection to minimize torsional stresses imposed on the pipe. The Contractor shall protect the pipe during pull back so that it moves freely and is not damaged. The Contractor shall take necessary measures to prevent the specified directional drill pipe from exceeding its maximum allowable stress. Once the pullback operation has started, the operations shall continue to completion. The pullback should be a single uninterrupted operation. If this is not possible a plan shall be submitted to the Public Works Commission for approval, including details of the number of separate pull back operations required. Replace any pipe damaged during installation at no additional cost to the Public Works Commission.

The Contractor shall install the pipe from either a pit which allows the pipe installation along the proposed grade directly or by drilling an initial sacrificial tangent section outside the limits of the proposed pipe segment which is then excavated and cut-off to make the pipe connection at the grades indicated.

The Contractor shall maintain proper lubrication during pipe pullback to reduce the exterior friction and possibility of the pipe seizing in place.

If forward motion or operation is stopped by an obstruction, the Contractor shall abandon the drill in place with drilling fluid, unless otherwise directed by the Public Works Commission. Upon approval from the Public Works Commission, the Contractor shall attempt a second installation

at an approved location. Withdrawals, abandonments, restarts and re-drills shall be completed at no additional cost to the Public Works Commission.

After installation, a minimum of 48 hours shall be allowed prior to cutting, in order for the specified directional drill pipe to experience stress relief. When connecting to an adjacent pulled or non-pulled section of pipe, the pulled section of pipe shall extend past the termination point. Sufficient pipe shall remain outside the borehole when pullback is completed, in order to connect to the direct bury portion of the project. After the stress relief, the specified directional drill pipe shall be cut to install the necessary valves, tees, and fittings as indicated on the drawings. All connections between the specified directional drill pipe and the direct bury pipe shall be restrained.

POST INSTALLATION CCTV INSPECTION

The Contractor shall perform post installation internal television inspections to verify that the installation is acceptable as defined herein. The finished DVD shall be continuous over the entire length of the installed water main or as specified by the Public Works Commission. The data and stationing are to be on the video. All such inspections shall be performed by personnel trained in locating breaks, obstacles and service connections by closed circuit color television. All original DVDs remain property of the Public Works Commission.

The CCTV inspection shall be performed after all work is completed, prior to testing. The Public Works Commission may, at its option, conduct an inspection of the new pipe to determine its condition subsequent to the HDD, prior to all work being completed. Any defects, which, in the opinion of the Public Works Commission affect the integrity of the pipe shall be replaced or repaired by the Contractor at no additional cost to the Public Works Commission. All repairs shall be submitted to the Public Works Commission for review and approval prior to commencing any repair work.

The post-installation CCTV inspections shall be performed so that the inner pipe can be clearly seen (not too much or too little light). Pipelines shall be thoroughly cleaned prior to performing the television inspections so that the entire pipe, including the bottom, can be clearly seen. All connections shall be clearly shown. The camera shall be panned, tilted and rotated at all defects and at the service lateral or pressure main connections for a complete video documentation.

The CCTV inspection shall include video documentation and computer generated logs to document the inspection. The final footage of the post-rehabilitation inspection shall be within 1% of the actual pipeline length as measured above ground.

The Contractor shall submit a sample CCTV inspection after the first installation so that the Contractor and the Public Works Commission can agree on the performance and quality of the inspections which must be met throughout the Contract. Pipelines not inspected to the Public Works Commission's satisfaction shall be re-inspected by the Contractor at no additional cost to the Public Works Commission.

One (1) copy of the DVDs and logs shall be submitted to the Public Works Commission for review and approval. Payment will not be made for any pipe installation until the Public Works Commission has reviewed and approved these videos. The Contractor shall submit the videos at least 10 days in advance of any payment request to provide the Public Works Commission ample time to review the videos.

REPORTING

The Contractor shall maintain and update an operator logbook on a daily basis. The logbook shall include the drill locator's notes and records of the bore from the steering and tracking system. The logbook should also include pipe diameter, depth, pitch, steering commands, drilling fluid circulation/volume and pressure, drilling fluid composition, ground conditions, date, time on-site, footage obtained during that day, pulling forces, torsional forces and any pertinent notes. The logbook shall be legible, accurate, and shall be submitted to the Public Works Commission upon completion of the work and made available throughout the installation process.

GROUND SURFACE MONITORING

Prior to beginning the HDD operation, the Contractor shall visually inspect the ground surface along the centerline and adjacent areas of the proposed bore. Any signs of settlement or heaving should be noted and reported to the Public Works Commission. The Contractor is required to survey and video existing conditions of the entire site and 50 feet either side of the proposed alignment prior to commencing construction activities. Surface elevations shall be surveyed within the prescribed drilling area in a grid pattern. Additional elevations of nearby structures such as roadways, bridges, buildings, slabs, etc. shall also be obtained. The video shall include any structures and their condition that are within the limits of construction or immediately adjacent to the work.

The Contractor shall monitor the ground surface along the centerline of the pipe, to observe any signs of settlement, heaving, or fracout due to the HDD operations. The Contractor shall make a visual inspection of the ground surface along the centerline of the pipe and adjoining areas on an hourly basis during the time of active drilling and backreaming. The Contractor shall record his visual observations for each inspection and provide this report to the Public Works Commission upon completion of the HDD operations.

If deemed necessary by the Public Works Commission, the Contractor shall establish surface settlement monitoring points along the centerline of the pipe and any additional monitoring points at locations deemed necessary. The monitoring points shall be installed in accordance with the following:

- a. Record location of settlement monitoring points with respect to construction baselines and elevations. Record elevations to an accuracy of 0.01 feet for each monitoring point location. Establish monitoring points at locations and by methods that protect them from damage by construction operations, tampering, or other external influences.
- b. Monitor ground settlement directly above and 10-ft before and after any utility or pipeline intersection.

The Contractor shall monitor these points during construction, and submit records of daily readings from the various surface settlement monitoring points. The Contractor shall immediately contact PWC if any loss of ground, roadway cracking, depression or settlement or other unusual activities are noted.

Settlement or heave of the ground surface along the HDD alignment shall not exceed 0.5-inches.

TESTING

Water mains installed by HDD will be hydrostatically tested prior to installation, unless otherwise approved by PWC. Once installed, the water main shall be hydrostatically tested, chlorinated, and bacteriological testing conducted in accordance with Section 02660 – Water Distribution. The Contractor shall fully cooperate with the PWC Project Coordinator to schedule and complete all testing.

ACCEPTANCE

Acceptance of the pipe shall be based on conformance with the requirements herein, the Public Works Commission's review of the installation monitoring, CCTV inspection, logbook, and results of all testing.

*** END OF SECTION ***

**DIVISION 2
SITE WORK
02350 - STEEL "H" PILES**

GENERAL

The work covered by this section consists of furnishing and driving steel H piles as indicated on the plans and as directed by the Engineer, in conformity with these specifications and to the bearing and penetration required.

MATERIALS

Steel H piles shall be of the sizes and weights shown on the drawings and shall conform to the requirements of ASTM A-36. The Contractor shall submit a manufacturer's certification to the Engineer that the H piles are in accordance with the project specifications.

INSTALLATION

Steel piles shall be handled and stored by methods that will not injure the pile. The piles shall be stored above the ground on platforms, blocks, or other supports. The piles shall be kept free from dirt, grease, and other foreign matter and shall be protected in so far as practical from corrosion.

The Contractor shall furnish sufficient lengths to develop load requirements as stated on the plans. Full butt-welded splices shall be used. H piles shall be driven to a minimum penetration of 10 feet by an approved hammer developing not less than 7500 ft.-lbs. of energy per blow. The load capacity of each pile shall be determined by the following formula:

$$Ra = \frac{2E}{S + 0.3}$$

where:

Ra	=	Safe load (lbs.)
E	=	Energy per blow (ft.-lbs.)
S	=	Final penetration per blow (inches) (average of last 6 blows)

Deviation of the location of the top of the pile from that shown on the plans shall not exceed 2 inches. A suitable driving cap shall be provided to prevent undue damage to the top of the pile. Piles shall be cut off at the required elevations along a plane normal to the axis of the pile. Methods used in cutting off piles shall meet the approval of the Engineer.

SHOP PAINTING

All steel piling shall be sandblasted in the shop to a minimum of SSPC-SP6-63. All sandblasted surfaces shall receive one (1) coat of Epoxy Primer the same day that piles are blasted. The primer shall be applied at the rate of 385 sq. ft. per gallon, which will provide 1.5 mils dry film thickness. Application method of the primer can be made by brush, roller brush, and conventional or airless spray.

FIELD PAINTING

After the piles have been driven, exposed primed surfaces shall be cleaned of dust and other foreign materials prior to applying two (2) coats of Coal Tar Epoxy at the rate of 90-115 square feet per gallon, which will provide a dry thickness of 8-10 mils coat. The minimum dry film thickness for the two coats shall be 16 mils. Application may be by brush, roller, conventional air spray or airless spray.

The re-coat time for the Coal Tar Epoxy can be as little as three (3) hours, but must not exceed 24 hours. Drying time of the coating is greatly affected by the temperature and humidity. If the first coat has exceeded the allotted time, it will be necessary to treat the coating prior to application of the second coat. The Coal Tar Epoxy shall not be applied in the rain or when the temperature is lower than 50 degrees F. Damaged surface areas due to handling and field welding must be wire brushed to original surface preparation and then coated with two (2) coats of Coal Tar Epoxy with minimum dry film thickness of 16 mils as specified above.

*** END OF SECTION ***

**DIVISION 2
SITE WORK
02500 – TRAFFIC CONTROL**

GENERAL

The purpose of these specifications is to outline the Contractor's requirements for furnishing, erecting, maintaining, relocating, and removing traffic control devices for the maintenance of traffic during the Contractor's construction operations. The Contractor shall furnish all labor, materials, accessories, equipment and tools for performing all required traffic control operations.

REFERENCES

All work shall be in accordance with:

- A. The North Carolina Department of Transportation Standards and Specifications for Roads and Structures (most recent edition)
- B. The North Carolina Department of Transportation Roadway Standard Drawings (most recent edition)
- C. The Manual on Uniform Traffic Control Devices (MUTCD) – most recent edition
- D. The North Carolina Supplement to the MUTCD
- E. Section 01000 – Special Conditions, of these Contract Documents

REQUIREMENTS

TRAFFIC CONTROL PLAN

The Contractor shall submit a traffic control and phasing plan for the overall project to be reviewed and approved by the PWC Project Engineer, prior to starting construction. The Contractor shall obtain an approved copy of the traffic control plan for the overall project area prior to any excavation within roadways. The plan must indicate how traffic will be managed, signage to be used, and potential traffic patterns resulting from plan implementation. The plan shall be submitted to the PWC Project Engineer in accordance with Section 01000 "Special Conditions" and Section 01300 "Submittals" of these Contract Documents. Failure of the Contractor to submit the required traffic control plan sufficiently in advance shall not entitle the Contractor to any extension of Contract Time.

TRAFFIC CONTROL DEVICES

The Contractor working in public rights-of-way on streets open to vehicular traffic, shall be required to provide, erect, and maintain all necessary traffic control devices throughout the project area to include any connecting streets affected by construction activities. The Contractor shall provide a sufficient number of personnel, and take all precautions for the protection of the work and safety of the public. All traffic control devices in place shall be in accordance with the approved traffic control plan. All traffic control devices and device installation shall be placed and maintained in strict accordance with the resources listed above. The Contractor shall be liable for any damages resulting from using unapproved and/or inadequate work zone traffic control. Fayetteville Public Works Commission reserves the

right to stop any work for non-compliance. The Contractor shall have no claim for delay due to stoppage of work as a result of non-compliance.

TRAFFIC CONTROL PLAN AND ROAD CLOSURE NOTIFICATION

1. TRAFFIC CONTROL PLAN – The Contractor shall notify the PWC Project Engineer, in writing, by 5:00 p.m. Wednesday, indicating which roadways will be affected by the work the following week. The Contractor shall notify NCDOT of work to be done per the terms of the approved encroachment agreement. The PWC Project Engineer shall receive copies of all correspondence via fax or email (PWC fax 910-829-0203; email addresses will be provided at the pre-construction meeting).

Traffic cannot be altered without notification and approval from the appropriate agency as outlined in the above paragraph. Failure to do so will result in the Contractor not being able to work within the street the next week.

No work on the individual streets shall start until all the traffic control devices required for the particular work activity have been installed in accordance with the approved traffic control plan.

2. ROAD CLOSURE NOTIFICATION - When deemed to be in the best interest of the public, Fayetteville Public Works Commission and the Contractor, a street may be closed for a duration mutually agreed upon. The Contractor shall submit a request in writing to the PWC Project Engineer for approval to have a street closed. The PWC Project Engineer will forward the request to the appropriate agency (i.e., City, Hope Mills, NCDOT) for approval of the closure. The PWC Project Engineer will include their recommendation regarding approval or disapproval of the request. The PWC Project Engineer will respond in writing with any recommendation for approval or disapproval of the request.

The request shall be submitted a minimum of five (5) business days prior to the desired closure date. The request shall include the street name and the limits of the closure based on the points of intersection. The request shall also state the proposed duration the street is to be closed and shall include a traffic control plan showing the detour route, traffic control devices, etc. The traffic control plan submitted shall be in accordance with the requirements listed in this Specification.

Once the street closure has been approved, in writing, by the PWC Project Engineer, the Contractor accepts full responsibility for the closure, to include the installation, maintenance, and removal of all traffic control devices and all implied liability.

TRAFFIC CONTROL LOOPS

The Town of Hope Mills, City of Fayetteville, and NCDOT maintain traffic detection loops at various intersections throughout the project limits. Due to the location of the proposed utility improvements, it may be necessary for these detection loops to be damaged. The Contractor shall coordinate with the appropriate agency a minimum of three (3) days prior to excavating, in order for the agency to locate these loops, or make any necessary revisions to the traffic signal facilities.

The agency will hire a third-party contractor to repair the damaged traffic detection loops. The invoice for this work shall be submitted to the Contractor for payment. The cost for this shall be incidental to the Contract.

STEEL PLATING ROADWAYS

Steel plating shall not be used without the prior written approval of the Project Engineer. The Contractor shall submit their proposed plan to utilize steel plates a minimum of five (5) working days prior to the proposed activity. Plating shall only be considered if the trench depths are 14 feet or greater. Should plating be approved the Contractor shall adhere to the following:

1. The trench shall be adequately shored to support bridging and traffic loads.
2. The trench box shall be sealed so there are no open voids.
3. Steel plates shall rest on trench box.
4. Steel plates shall extend beyond the outer edges of the trench box on all four sides.
5. There must be a minimum of two (2) feet of compacted backfill above steel plates.
6. Compacted backfill shall match existing street grade.
7. Provide documentation that the plates are capable of supporting potential loads.

Steel plating shall not exceed two (2) consecutive calendar days in any given week. However, provided that work is progressing in that particular section of sewer the Contractor may be allowed to utilize plating for a longer duration as approved in writing by the Project Engineer.

STEEL PLATING ROADWAYS (NCDOT STREETS)

Steel plating shall not be used without the prior written approval of Fayetteville Public Works Commission Project Engineer. The Contractor shall submit their proposed plan to utilize steel plates a minimum of five (5) business days prior to the proposed activity. Should plating be approved, the Contractor shall adhere to the following:

1. The plates shall be secured against any movement from traffic. Options include “countersinking” the plates to be flush with the existing pavement, or bolting the plates to the pavement.
2. The plates shall overlap the excavation a minimum of two (2) feet on all sides.
3. The plates shall be sufficient to withstand the expected traffic loads.
4. Provide documentation that the plates are capable of supporting potential loads.

Steel plating shall not exceed two (2) consecutive calendar days in any given week. However, provided that work is progressing in that particular section of the project, the Contractor may be allowed to utilize plating for a longer duration as approved in writing by Fayetteville Public Works Commission Project Engineer.

MATERIALS

- A. The Contractor shall utilize interim pavement marking paint as specified in the North Carolina Department of Transportation Standards and Specifications for Roads and Structures (most recent edition)

- B. Traffic cones may be utilized when approved by Fayetteville Public Works Commission Project Engineer. If approved, traffic cones shall either be double stacked or weighted to prevent movement by traffic.
- C. All traffic control devices furnished by the Contractor shall remain the property of the Contractor, unless otherwise specified in these Contract Documents.

INSTALLATION

The furnishing, erecting, maintaining, relocating, and removal of traffic control devices shall be in accordance with the MUTCD (most recent edition), the requirements outlined in the approved traffic control plan, and these Contract Documents.

All traffic control devices shall be in place prior to the Contractor beginning work, removed during intervals when work is not on-going, and removed at the end of each business day (unless otherwise approved, as outlined in this specification).

The Contractor shall not obstruct or impede any traffic on adjacent streets, during the installation or removal of the traffic control devices, or during construction.

The Contractor shall not close a lane to through traffic after normal working hours and during periods of construction inactivity, unless otherwise approved in writing by Fayetteville Public Works Commission Project Engineer.

Fayetteville Public Works Commission Project Engineer may restrict the Contractor from placing lane closures during certain hours, holidays, or as deemed necessary for the convenience of the public. All lane closure types, hours of installation, and durations shall be as approved in writing by Fayetteville Public Works Commission Project Engineer.

The use of police and/or trained flaggers to control traffic through the work site shall be provided by the Contractor as required. The Contractor shall be responsible for obtaining trained personnel to direct traffic and contacting local authorities for use of police for traffic control where applicable.

INTERIM PAVEMENT MARKINGS

The Contractor shall be required to place interim pavement markings (centerlines, lane lines, edgelines, railroad, and school symbols) daily on any street with existing pavement markings that have been obliterated.

THERMOPLASTIC PAVEMENT MARKINGS

The Contractor shall be required to place thermoplastic pavement marking centerlines, lane lines, and edge lines within three (3) calendar days after the completion of the resurfacing operation.

The Contractor shall be required to place all thermoplastic pavement marking symbols (arrows, crosswalks, stop lines, school symbols, railroad symbols, raised pavement markers, etc.) within seven (7) calendar days of the completion of the project.

NCDOT STREETS

All traffic control measures for work within NCDOT road rights-of-way shall be in accordance with the approved NCDOT encroachment agreement, and as specified herein. Where there is a conflict between the requirements of this specification and the approved encroachment, the requirements of the approved encroachment shall govern.

END OF SECTION

**DIVISION 2
SITE WORK
02505 - ADJUSTMENT OF EXISTING STRUCTURES**

GENERAL

The work covered by this specification consists of the raising or lowering of existing manholes and valve boxes encountered within the limits of the project to match the adjacent finished work.

RELATED SECTIONS

- A. 02222 – Excavation and Backfilling for Utility Systems
- B. 02660 – Water Distribution
- C. 02730 – Sanitary Sewer Systems

Where conflicts occur between the specifications, the more stringent requirement shall apply.

MATERIALS

All materials shall be in strict accordance with the requirements of the Public Works Commission and as set forth in this standard.

Adjustable riser rings are not approved for use within the Public Works Commission water and/or sewer system. All manhole adjustments shall be done utilizing a concrete grade ring. If a concrete grade ring cannot be utilized, the manhole shall be broken down and rebuilt to the proper grade, in accordance with PWC standards.

INSTALLATION

Adjustment of structures shall not be performed until after placement of base course and/or any leveling course, and prior to placement of final course. All adjustments of structures shall be accomplished a minimum of 72 hours prior to placing the final surface course. All defective, damaged, or worn castings shall be replaced with new castings provided by the Public Works Commission at no cost to the Contractor. The Contractor shall be responsible for exchanging castings at the Public Works Commission's facility.

The Contractor shall take all necessary precautions to prevent debris from entering the sanitary sewer system. Any debris that falls into the manhole or valve box during adjustment shall be removed immediately.

Manholes

For all manholes that need adjustment, the Contractor shall remove all concrete grade rings to the top of the cone section. All loose material shall be removed and properly disposed of. The Contractor shall utilize new concrete grade rings to ensure that the new manhole ring and cover will be at final grade. If no concrete grade rings are required to adjust the structure to final grade, the Contractor shall set the ring and cover in a bed of clean fresh mortar.

If the manhole needs to be lowered, and there are no existing concrete grade rings, then the Contractor shall tear down the existing manhole and rebuild it, utilizing new riser and cone

sections, in order to ensure that the installed ring and cover will be at final grade. The Contractor shall remove all necessary sections of the existing manhole in order to make the adjustment.

If the manhole needs to be raised, and there are 12-inches of concrete grade rings already in place, the Contractor shall tear down the existing manhole and re-build it. The Contractor shall utilize new riser and cone sections, as required, to ensure that the installed ring and cover will be at final grade. The Contractor shall remove all necessary sections of the existing manhole in order to make the adjustment.

Valve Boxes

In order to adjust valve boxes, the top section of the valve box shall be raised or lowered as required to meet the final grade. If the height of the final grade exceeds the length of the existing top section, the Contractor shall remove the existing valve box and install a new one at final grade.

All adjustments shall be protected for at least 72 hours before the placement of any surfacing material, in order to allow the concrete to properly set. The Contractor shall be responsible for protecting the raised structure from damage due to traffic. After the 72 hours, a temporary asphalt transition shall be placed around the raised structure, to allow vehicular traffic to pass over. The asphalt transition shall extend a minimum of 18 inches from the structure in every direction. The Contractor shall be responsible for maintaining this asphalt transition until such time the final surface course is placed. Immediately prior to paving, the asphalt transition shall be removed. In the event paving is stopped for the day prior to completing the work, the Contractor shall re-install the temporary asphalt transition. The finish surface tolerance shall not vary more than ¼" (0.25 inch) in any direction. Every effort shall be made to ensure that the surface course and castings provide as smooth a ride as possible.

END OF SECTION

**DIVISION 2
SITE WORK
02573 - PERMANENT PAVEMENT PATCH**

GENERAL

Permanent pavement patching shall be completed as indicated on the Contract Plans and in accordance with these Contract Documents. The intent and purpose of these specifications is to require a complete and satisfactory installation in every respect and any defect in material or workmanship shall be cause for replacement and correction of such defect as directed by the Public Works Commission. All materials and workmanship shall be in complete accordance with the standards and specifications of the Public Works Commission and subject to Public Works Commission inspection and approval. The materials and installation shall conform to the North Carolina Department of Transportation (NCDOT) Standards, (latest revision), the NCDOT HMA/QMS Manual (latest revision), and as specified herein.

REMOVAL

The Contractor shall cut the existing pavement to straight uniform widths parallel and perpendicular to the roadway. Jagged saw cuts will not be acceptable. The pavement shall be removed its entire depth. The Contractor shall properly dispose of all removed pavement. If the Contractor elects to mill the asphalt, the millings cannot exceed two (2) inches in size, and shall be swept into the trench and re-compacted. The removal limits shall extend a minimum of six (6) inches into solid undisturbed base course prior to patching or as directed by the Public Works Commission.

Pavement removal shall not exceed 3,000 feet total for the entire project at one time. It shall be the Contractor's responsibility to maintain the trench (swept, wetted, compacted, etc.) until paved.

PAVEMENT

Replacing the pavement shall consist of the following:

Tack Coat

All existing pavement edges shall be tacked in accordance with the North Carolina Department of Transportation Standard Specifications for Roads and Structures (latest revision).

Asphalt Surface Course

The asphalt surface course shall be Type S9.5, placed in accordance with the PWC Standard Detail M.2. All asphalt surface course shall be in accordance with the NCDOT HMA/QMS Manual (latest revision) and the North Carolina Department of Transportation Standard Specifications for Roads and Structures (latest revision).

The pavement repair shall be constructed to the line, grade, crown and cross section of the existing street. The asphalt plant mix shall be compacted to density in accordance with the HMA/QMS Manual (latest revision). The Contractor shall provide a smooth transition from the

existing pavement to the top of the backfill, so as to have no vertical drop (in any direction). The transitions shall only be removed the day of patch paving.

The permanent pavement patch shall be made within 30 days of installation of the line. If settlement should occur within one (1) year warranty period, the Contractor shall be required to remove asphalt, re-compact base and sub-base, and re-patch any areas of settlement at no expense to PWC. All repairs shall be in accordance with these Contract Documents.

Base Course

The base course shall be aggregate base course (ABC) installed to a minimum eight (8) inches thickness (compacted) and extending a minimum of six (6) inches beyond the edge of the trench as indicated on the PWC Standard Detail M.2. The base course shall be compacted to 100% maximum dry density at optimum moisture content as determined by the AASHTO T-99 as modified by NCDOT.

The Contractor, with permission of the Public Works Commission, may use asphalt concrete intermediate course, placed in a minimum four (4) inch layer extending a minimum of six (6) inches beyond the edge of the trench as indicated on the Permanent Patch Detail. The Asphalt Concrete Intermediate Course shall be in accordance with the North Carolina Department of Transportation Standard Specifications (latest revision), and the NCDOT HMA/QMS Manual (latest revision).

Prior to patch paving, the Contractor shall remove the upper ten (10) inches of backfill, if ABC is to be used or upper six (6) inches if Asphalt Concrete Intermediate Course is to be used, in the trench. All asphalt edges along the trench shall be cut straight, uniform width, parallel and perpendicular to the road with no jagged edges. The outer six (6) inches (minimum) of the trench adjacent to the newly removed asphalt shall be on undisturbed soil.

The pavement repair shall be constructed to the line, grade, crown and cross section of the existing street. The asphalt plant mix shall be compacted to density in accordance with the HMA/QMS Manual.

Maintenance shall be performed at least weekly, after a rainfall, or at the direction of the Public Works Commission. Maintenance shall include sweeping the adjoining pavement, blading, wetting and compacting the stone to insure smooth drivable surface.

END OF SECTION

**DIVISION 2
SITE WORK
02574 – TEMPORARY PAVEMENT PATCH**

GENERAL

Open cutting and replacing existing pavement shall be performed in accordance with these Contract Documents. The materials and installation shall conform to the North Carolina Department of Transportation Standard Specification (most recent edition), the NCDOT HMA/QMS Manual (most recent edition), and as specified herein. Encroachment permits will be obtained by the Public Works Commission, but all necessary insurance as required by NCDOT shall be furnished and paid for by the Contractor.

REMOVAL

The Contractor shall cut the existing pavement to straight uniform widths parallel and perpendicular to the roadway. Jagged saw cuts will not be acceptable. The pavement shall be removed its entire depth. The Contractor shall properly dispose of all removed pavement. If the Contractor elects to mill the asphalt, the millings cannot exceed two (2) inches in size, and shall be swept into the trench and re-compacted. The removal limits shall extend a minimum of six (6) inches into solid undisturbed base course prior to patching or as directed by the Public Works Commission.

Pavement removal shall not exceed 3,000 feet total for the entire project at one time. It shall be the Contractor's responsibility to maintain the trench (swept, wetted, compacted, etc.) until paved.

PAVEMENT

Replacing the pavement shall consist of the following:

Tack Coat

All existing pavement edges shall be tacked in accordance with the North Carolina Department of Transportation Standard Specifications for Roads and Structures (most recent edition).

Asphalt Surface Course

Where streets are indicated to be temporarily patched and overlaid with an asphalt surface course, the patch shall be constructed of asphalt intermediate course, Type I-19.0. The Asphalt Intermediate Course, material shall be in accordance with NCDOT Standard Specifications for Roads and Structures (most recent edition) and the NCDOT HMA/QMS Manual (most recent edition).

The pavement repair shall be constructed to the line, grade, crown and cross section of the existing street. The asphalt plant mix shall be compacted to density in accordance with the NCDOT HMA/QMS Manual (most recent edition).

The temporary pavement patch shall be a minimum three (3) inches compacted thickness and extend a minimum of six (6) inches beyond the edge of the trench in accordance with the PWC

Standard Detail. No more than 24 hours prior to patch paving, the Contractor shall remove the upper three (3) inches of backfill in the trench. All asphalt edges along the trench shall be cut straight, uniform width, parallel and perpendicular to the road with no jagged edges. The outer six (6) inches (minimum) of the trench adjacent to the newly removed asphalt shall be on undisturbed soil. The Contractor shall provide a smooth transition from the existing pavement to the top of the backfill, so as to have no vertical drop (in any direction). The transitions shall only be removed the day of patch paving.

The temporary pavement patch shall be made within thirty (30) days of installation of the line. If settlement should occur within the one (1) year warranty period, the Contractor shall be required to remove asphalt, re-compact base and sub-base, and re-patch any areas of settlement at no expense to PWC. All repairs shall be in accordance with these Contract Documents.

END OF SECTION

02575 – DRIVEWAY REPLACEMENT GENERAL

Removal and replacement of existing driveways is required as indicated in the Contract Drawings and shall conform to the requirements of this Specification and the Contract Documents. The Contractor shall furnish all labor, equipment, materials, and incidentals necessary for the removal and replacement of the driveways disturbed as part of the utility construction. The intent and purpose of these specifications is to require a complete and satisfactory installation in every respect and any defects in material or workmanship shall be cause for the replacement and correction of such defect as directed by the Public Works Commission at no expense to the Public Works Commission.

All work shall be done in accordance with the terms and conditions outlined herein, the Public Works Commission "Manual for the Design and Construction of Water and Wastewater System Extensions" (most recent edition), in accordance with the North Carolina Department of Transportation "Standard Specifications for Roads and Structures" (most recent edition), and subject to final approval and acceptance by the Public Works Commission. In case of conflicting requirements between this Specification and the above referenced documents, this Specification shall govern.

The Contractor shall provide resident's access to their driveways at all times. The Contractor shall coordinate with the resident to provide access to their home during removal and replacement of the driveway. The Contractor shall make every attempt to coordinate their efforts with the schedule and wishes of the resident.

RELATED SECTIONS

- A. 02222 – Excavation and Backfilling for Utility Systems

REMOVAL

The Contractor shall provide a neat edge along the concrete or asphalt driveway pavement being retained by sawing, straight and true, approximately two (2) inches deep before breaking away. The portion of driveway to be removed shall be as indicated on the Contract Drawings or as directed by the PWC Project Coordinator. The concrete or asphalt driveway pavement shall be removed for its entire depth, removed from the site, and disposed of at the Contractor's sole expense.

The Contractor shall remove the existing gravel drive to the limits shown on the Contract Drawings or as directed by the PWC Project Coordinator. The driveway shall be removed for its entire depth, removed from the site, and disposed of at the Contractor's sole expense.

ASPHALT DRIVES

Replacing the asphalt driveway shall consist of the following:

Base Course:

The stabilized aggregate base course shall be installed to a minimum eight (8) inches compacted

thickness as indicated on the Asphalt Driveway Patch Detail. The base course shall be compacted to 100% maximum dry density at optimum moisture content as determined by the AASHTO T-99 as modified by NCDOT. In lieu of utilizing aggregate base course, the Contractor, with approval from the City of Fayetteville, may utilize a minimum of four (4) inches of I-19.0 intermediate course.

In locations approved by the PWC Project Engineer, where the stone base course is to remain for a defined period of time prior to asphalt paving, the stone base course shall be maintained by the Contractor. Maintenance shall include sweeping the adjoining pavement, blading and/or leveling the stone, compacting and wetting the stone to insure smooth driveable surface. The Contractor shall have on the project the proper equipment to complete this work. Maintenance shall be performed at least weekly, after a rainfall, or at the direction of the PWC Project Engineer.

Tack Coat:

All existing pavement edges shall be tacked in accordance with the North Carolina Department of Transportation Standard Specifications for Roads and Structures (most recent edition).

Bituminous Concrete Surface Course:

The bituminous concrete surface course shall be Type SF9.5, placed in a two (2) inch minimum thickness or to the existing full depth thickness whichever is greater and in strict accordance with the North Carolina Department of Transportation Standard Specifications for Roads and Structures (most recent edition).

CONCRETE DRIVES

Where new concrete is to be placed against existing concrete, preformed expansion joint filler, three-quarter inches in width and of a depth extending for the full thickness of the slab, shall be used. All concrete shall have a minimum 28 day compressive strength of 3,000 psi and shall be placed to the same thickness as the removed portion except that in no case shall any new slab be less than five (5) inches thick. The concrete shall be accurately screed to produce a uniform surface, floated, and given a broom finish. All work shall be in accordance with PWC standard details and City of Fayetteville requirements.

GRAVEL DRIVES

Gravel driveways shall be restored or replaced in all locations disturbed by construction. The replacement gravel driveway shall consist of six (6) inches thick compacted Number 57 stone or aggregate base course stone, whichever matches or more closely matches the existing gravel driveway.

ACCEPTANCE

Acceptance of the installed driveways shall be based on the conformance with the requirements outlined herein, the Public Works Commission's review of the installation, and written concurrence

from the property owner. The Public Works Commission will not accept any installation without the written release from the property owner. The Contractor shall be responsible for obtaining the written release from the property owner.

WARRANTY

If settlement should occur within one (1) year, the Contractor shall repair/re-pave the area to provide a smooth transition between the new and existing driveways. The finished product shall be neat in appearance and of equal or exceeding quality of the surrounding driveway or area.

END OF SECTION

**DIVISION 2
SITE WORK
02584 - ROADWAY AND PARKING LOT MARKING**

GENERAL

The pavement markings shall be in strict accordance with both NCDOT Standard Specifications for Roads and Structures (most recent edition) and U.S. Department of Transportation, Federal Highway Administration's Manual for Uniform Traffic Control Devices for Streets and Highways.

MATERIALS

The traffic and zone marking paint shall be white, yellow or blue alkyd-chlorinated rubber chlorinated paraffin as manufactured by PPG Industries, General Paint and Chemical Company, Sherwin-Williams or an approved equal. The paint shall be in accordance with AASHTO M248, Type III.

INSTALLATION

The Contractor shall lay out all work including traffic lanes, arrows, spaces, handicap aisles, etc and other pavement markings as indicated on the Contract Drawings. Prior to the application of any paint, the pavement surface shall be cleaned of all dirt, trash and the surface shall be free of any material that would prevent adherence of paint. The paint shall be applied to a dry surface using either a template or striping machine. Stripes shall be uniform weight and width. Stripe width shall be 4 inches unless otherwise shown on the Contract Drawings.

END OF SECTION

02660 - WATER DISTRIBUTION

GENERAL

Water lines and all appurtenant items shall be constructed of materials specified and/or as indicated on the approved drawings. The intent and purpose of these specifications is to require a complete and satisfactory installation in every respect and any defects in material or workmanship shall be cause for the replacement and correction of such defect as directed by Fayetteville Public Works Commission (PWC) at no expense to Fayetteville Public Works Commission.

- C. 02301 – Boring And Jacking (Roadways And Railroads)

MATERIALS

MANUALLY OPERATED GATE VALVES

All manually operated gate valves four (4) inches and larger shall be ductile iron or cast iron body resilient wedge type rated for 250 psig working pressure gate valves and shall conform to American Water Works Association (AWWA) C-509/C-515 and NSF 61. All valves must open counter-clockwise equipped with a two (2) inch square operating nut. The operating nut shall have an arrow cut in the metal, indicating the direction of opening. All valves shall have a non-rising stem. All valves up to and including thirty-six (36) inch diameter shall have triple "O" ring stem seals. The design and machining of valves shall be such as to permit the replacement of the upper two (2) "O" rings without undue leakage while the valve is wide open and in service. The wedge shall be ductile iron encapsulated in nitrile rubber (for four (4) inch through 12 inch) and SBR rubber for 14-inch through 24-inch sizes.. All internal and external surfaces of the valve body and bonnet shall have a fusion bonded epoxy coating complying with ANSI/AWWA C550 applied electrostatically prior to assembly, conforming to AWWA C-550-90. All valves up to and including 36-inch diameter shall have a safe working pressure of 250 psi. Valve connections shall be as required for the piping in which they are installed. Valves shall have a clear waterway equal to the full nominal diameter of the valve. All valves shall be tested for leakage and distortion in strict accordance with the latest revision of AWWA Specification C-500.

Gate valves installed in meter vaults shall have a wheel in lieu of a square operating nut and shall also have a non-rising stem. The wheel shall have an arrow cut in the metal indicating the direction of opening. Flanges shall not be buried. An approved pit shall be provided for all flange connections.

Resilient seated tapping valves shall be furnished with the tapping flange having a raised face or lip designed to engage the corresponding recess in the tapping sleeve flange in accordance with MSS-SP60. Tapping valves without the raised face on the tapping flange are not permitted since they do not assure the proper alignment required to prevent damage by a misaligned shell cutter. The interior of the waterway in the body shall be a full opening and capable of passing a full sized shell cutter equal to the nominal diameter of the valve.

All valves shall be manufactured in strict accordance with the latest specifications of the American Water Works Association (AWWA). Valves shall be manufactured by: Mueller Company, Clow Corporation, or American Darling Company. Certification shall be furnished to Fayetteville Public Works Commission by the manufacturer that all valves are in accordance with PWC standards. Where specified on the plans and approved by Fayetteville Public Works Commission, resilient wedge gate valves may be furnished with spur gearing for valves installed in a vertical position and bevel gearing for valves installed in a horizontal position. All gate valves shall be installed in accordance with PWC standard details.

BALL VALVES

For all valves smaller than four (4) inches, ball valves shall be used. Ball valves shall be installed in accordance with PWC standard details.

Ball valves shall be all bronze construction, with tee head operator and having a removable disc. Ball valves shall have threaded connections, in accordance with PWC standard details. Ball valves shall be manufactured and tested in accordance with AWWA/ANSI C800. The valve shall be equipped with packing nut, gland, and packing material. Ball valves shall be of an approved type made from approved materials conforming to ASTM Specifications and shall also meet the approval of the Public Works Commission. The turn required to travel from fully closed to fully open on the ball valve shall be 90 degrees.

VALVE BOXES

Valve boxes shall be "slip-type" made of close-grained, gray cast iron metal painted with a protective asphaltic coating. Construction shall be in three pieces as follows: The lower of base pieces, which shall be flanged at the bottom, the upper part which shall be flanged on the lower end, and of such size as to telescope over the lower part, the upper end being constructed in the form of a socket to receive the cap or cover; and the cover or cap shall have cast on the upper surface, in raised letters, the word "WATER". All valve boxes shall be equal in quality and workmanship to those manufactured by Sigma Corporation (VB-462), Tyler Union (6855 Series), Star Pipe Products (VB-0004), or an approved equal. The valve box shall be installed in accordance with PWC standard details. The valve box shall have a 3/8-inch hole drilled in the upper part four (4) to six (6) inches from the top of the box to accommodate a 1/4-inch x 1-1/2-inch galvanized bolt for securing tracer wire.

Valve box protector rings shall be installed to protect valve boxes located outside pavement. The ring shall be constructed and installed in accordance with PWC standard details.

FIRE HYDRANTS

All fire hydrants shall be dry barrel, traffic type and conform to the latest revision of AWWA Specification C-502 except as listed below or as otherwise directed by the Public Works Commission. All working parts shall be bronzed. The size of the fire hydrants (designated by the nominal diameter of the valve opening) shall not be less than four and one-half (4 1/2) inches. All hydrants shall be able to deliver a minimum of 1,000 gallons per minute with a friction loss of not more than five (5) pounds per square inch (psi) total head loss through the hydrant. Hydrants shall be of compression type (opening shall be of such design that when the barrel is broken off

the hydrant valve will remain closed and reasonably tight against leakage). All hydrants shall be mechanical joint to accommodate the spigot end of six (6) inch Pressure Class 150, AWWA Standard, ductile iron pipe. The installation of the fire hydrant shall be in accordance with PWC standard details. Bosses (6") may be substituted for tees in pipe sizes exceeding 24 inches in diameter, with prior approval from PWC. The boss shall be welded to the bottom of the main to provide effective flushing of the system.

All hydrants shall be furnished with two (2) two and one-half (2 ½) inch nozzles and one (1) four and one-half (4 ½) inch pumper nozzle. Outlets shall have American National Standard fire hose coupling thread, in accordance with the City of Fayetteville standard, and shall be provided with nozzle caps securely chained to the body of the hydrant. The base of the hydrant shall have two (2) cast lugs suitable for use in strapping the hydrant to the connecting pipe. The operating nut shall be pentagonal in shape, finished with a slight taper to one and one-half (1 ½) inches from point to flat to conform to the standard wrench used by Fayetteville Public Works Commission. All hydrants shall open left or counter-clockwise. Hydrants shall be suitable for working pressure of 150 psi and a test pressure of twice the working pressure. Fire hydrants shall be specific models manufactured by Mueller Company (Model Centurian 200), Clow Corporation (Medallion), American Darling (Model Mark 73-1) or approved equal. The interior of the hydrant shoe shall be coated with a four (4) mil thickness FDA approved epoxy coating.

COMBINATION AIR VALVES ASSEMBLY

Combination air valves shall be of the single housing style that combines the operation features of both an air/vacuum and air release valve. The combination air valve shall have a two (2) inch inlet and one (1) inch outlet connections and an orifice diameter to be determined by the Design Engineer for each project for a maximum working pressure of 300 psi. The assembly shall be equipped with a two (2) inch cut-off valve as shown on the PWC standard detail. The combination air valve body shall be constructed of 316 stainless steel or reinforced nylon with the only exception being the Buna-N Rubber seat and gasket. Valves shall be as manufactured by Crispin (Model UX20), ARI (D-020), or approved equal. Combination air valves shall be installed in accordance with PWC standards.

WATER DISTRIBUTION PIPE

DUCTILE IRON PIPE

The raw material from all ductile iron pipe and fittings shall have an average minimum content consisting of 90% recycled iron and steel. Ductile iron pipe and fittings shall be manufactured in the United States of America in accordance with ANSI/AWWA A21.51/C151. The manufacturer of the ductile iron pipe shall be a member of the Ductile Iron Pipe Research Association (DIPRA).

All ductile iron pipe shall be designated as "Pressure Class", unless otherwise specified. The pipe furnished shall have a minimum thickness calculated in accordance with ANSI A 21.50 (AWWA C-150), with a factor of safety of two (2); a working pressure of 150 psi to 350 psi, plus 100 psi water hammer allowance; and AASHTO H-20 live truck load with 2.5 feet of cover. In no case shall "Pressure Class" pipe's nominal thickness be less than the following:

<u>SIZE</u>	<u>PRESSURE CLASS</u>	<u>NOMINAL THICKNESS (In.)</u>
-------------	-----------------------	--------------------------------

4"		350		0.25
6"	350		0.25	
8"	350		0.25	
10"	350		0.26	
12"	350		0.28	
16"	250		0.30	
24"	250		0.37	

PUSH-ON JOINTS

Push-on joints shall be as specified and installed in accordance with AWWA C-600 and shall conform to AWWA Standard C-111. Push on joints, rubber gaskets and lubricant shall conform to ANSI A21.11. Pressure rating shall not be less than 200 psi unless otherwise specified. All ductile iron pipe shall be lined with standard thickness cement mortar lining and asphaltic seal coat in accordance with ANSI A21.4 (AWWA C-104). The pipe shall have an outside asphaltic coating as specified in AWWA Standard C-151.

RESTRAINED JOINTS

Factory Restrained Joints

Factory restrained joint pipe shall be utilized for all pipe greater than 12-inches in diameter, unless otherwise approved by Fayetteville Public Works Commission. Factory restrained joint pipe shall be furnished for the locations shown on the approved drawings. The pipe, joints, and gaskets shall be in accordance with ANSI/AWWA Standards as specified for ductile iron pipe. Factory restrained joints shall be rated for a working pressure of 350 psi for sizes up to 12-inches and 250 psi for larger sizes.

All factory restrained joint pipe shall have the restraints internal to the pipe (i.e., "boltless"). All restrained joint ductile iron pipe and fittings larger than 12-inches shall be as manufactured by U.S. Pipe's TR-Flex, Griffin Pipe Products SNAP-LOK, American Cast Iron Pipe Company's Flex-Ring Joint, or approved equal. The method of restraining the valves to the factory restrained ductile iron pipe shall be reviewed and approved by PWC on a case by case basis. The valves shall have the same working pressure as the pipe.

Flanged Joints

Flanges shall be specifically designed for each application. The flange pipe shall be in accordance with ANSI/AWWA C-115/A21.15. Threads for threaded flange pipe shall be in accordance with ANSI B2.1, shop fabricated as outlined by AWWA 115 with serrated faces furnished on the pipe, completely factory installed. Welding of flanges to the body of the pipe will not be acceptable.

Ductile iron fittings and flanges shall be in accordance with ANSI/AWWA C-110/A21.10 with a minimum working pressure of 250 psi. Gaskets shall be full faced SBR rubber per ANSI/AWWA C-111/A21.11 with a minimum 1/8 inch thickness. Linings and coatings shall be as previously outlined for all ductile iron pipe and fittings.

Mechanical Joints

Mechanical joints shall be as specified and installed in accordance with AWWA C-600 and shall conform to AWWA Standard C-111. Mechanical joints shall be of the stuffing box type and shall conform to ANSI A21.11 for four (4) inch pipe through 12-inch pipe. Mechanical joints, rubber gaskets and lubricant shall conform to ANSI A21.11. Pressure rating shall not be less than 200 psi unless otherwise specified.

Special accessories such as mechanical joint retainer glands or mega-lugs are acceptable on pipe 12-inches and less in diameter, upon approval from Fayetteville Public Works Commission. Mega-lug and/or grip-ring restraint mechanisms will not be an acceptable method of restraint for pipe, fitting and/or valves on sizes larger than 12-inches in diameter. For mains larger than 12-inches and at locations specified by Fayetteville Public Works Commission, factory restrained joints shall be utilized, in accordance with these Specifications.

Field Lok Gaskets

Special accessories such as US Pipe's Field-LOK gasket, Ford's Uni-Ring, or Romac's Grip-Ring are acceptable on pipe 12-inches and less in diameter, upon approval from Fayetteville Public Works Commission. Mega-lug and/or grip-ring restraint mechanisms will not be an acceptable method of restraint for pipe, fitting and/or valves on sizes larger than 12-inches in diameter. For mains larger than 12-inches and at locations specified by Fayetteville Public Works Commission, factory restrained joints shall be utilized, in accordance with these Specifications.

FITTINGS

Mechanical Joint

All fittings shall be ductile iron and shall be manufactured in accordance with AWWA Standard C-110 (ANSI A21.11). Compact fittings shall be mechanically restrained, ductile iron in accordance with ANSI A 21.53 (AWWA C-153) for four (4) inch through 12 inch sizes only. Where thrust blocking is utilized, fittings shall be full body ductile iron in accordance with ANSI A 21.53 (AWWA C110).

All ductile iron fittings shall be lined with standard thickness cement mortar lining and asphaltic seal coat in accordance with ANSI A21.4 (AWWA C-104). All fittings shall have an outside asphaltic coating as specified in AWWA Standard C-151 and C-110, respectively.

Factory Restrained

Factory restrained joint fittings shall be utilized for all pipe greater than 12-inches in diameter, unless otherwise approved by Fayetteville Public Works Commission. Factory restrained joint fittings shall be furnished for the locations shown on the approved drawings. The fittings, joints, and gaskets shall be in accordance with ANSI/AWWA Standards as previously specified for ductile iron pipe. Factory restrained joints shall be rated for a working pressure of 350 psi for sizes up to 12-inches and 250 psi for larger sizes. All factory restrained joint fittings shall have the restraints internal to the fitting (i.e., "boltless"). All fittings shall be compatible with the factory restraint system. All restrained joint ductile iron fittings larger than 12-inches shall be as manufactured by U.S. Pipe's TR-Flex, Griffin Pipe Products SNAP-LOK, American Cast Iron Pipe Company's Flex-Ring Joint, or approved equal.

Bosses

Tangential welded on outlets (i.e., bosses) shall only be utilized on pipe 24-inches and larger, as approved by PWC. All bosses shall be factory welded; field fabrication is not allowed. The pipe shall be in accordance with these specifications. Bosses shall be of the size and location indicated on the approved drawings.

AERIAL CROSSINGS

For aerial crossings, the ductile iron pipe shall be thickness class, as specified on the plans and standard details. All thickness class pipe shall be in accordance with ANSI A21.51 and AWWA C-151, with a minimum working pressure of 200 psi.

For aerial crossings which are four (4) inches to 12 inches in diameter, Class 53 manufactured factory restrained joint or Class 53 flanged ductile iron pipe shall be used in accordance with the PWC standard details. No other means of restraint are allowed for aerial crossings. For aerial crossings larger than 12 inches, or as noted specifically on the plans, Class 53 flanged ductile iron pipe shall be used in accordance with the PWC standard details.

All aerial crossings shall be designed and installed in accordance with PWC standard details.

PIPE IN CASINGS

All ductile iron pipe (regardless of diameter) within casings shall be factory restrained, in accordance with these specifications and the applicable PWC standard details. The use of any other restraints (i.e., mega-lugs, grip-rings, etc.) shall not be utilized on pipe within casings.

All restrained joint ductile pipe in casings shall be in accordance with the PWC standard details.

TRENCHLESS APPLICATIONS

All ductile iron pipe (regardless of diameter) utilized for trenchless installations (i.e., horizontal directional drilling, pipe-bursting, etc.) shall be factory restrained, in accordance with these specifications and the applicable specification section for the trenchless technology. The use of any other restraints (i.e., mega-lugs, grip-rings, etc.) shall not be utilized.

PVC PIPE

Two (2) inch water main pipe shall be manufactured using Grade 1 PVC compound material as defined in ASTM D-1784 and shall be SDR21, pressure class 200 in accordance with ASTM D 2241. Fittings for two (2) PVC pipe shall be solvent weld Schedule 80 PVC. Brass FIP x pack joint for PVC fittings shall be used to transition from PVC to brass. The pipe shall be plainly marked with the manufacturer's name, size, material (PVC) type and grade or compound, NSF seal, date of manufacture, pressure rating and reference to appropriate product standards.

All PVC pipe (4-inches through 12-inches diameter) shall be manufactured using virgin compounds as defined in ASTM D-1784, with a 4,000 psi HDB rating and designated as PVC 1120 to be in strict accordance with AWWA C-900. The pipe shall be Class 150 and conform to

the thickness requirements of DR18. The pipe shall be manufactured to withstand 755 psi quick burst pressure tested in accordance with ASTM D-1599 and withstand 500 psi for a minimum of 1,000 hours tested in accordance with ASTM D-1598. The pipe joints shall be of the integral bell type with rubber gaskets and shall conform to the requirements of ASTM D-3139 or ASTM F-477.

PVC fittings are not acceptable for water mains four (4) inches or greater. Fittings and specials shall be ductile iron, bell end in accordance with AWWA C-110, 150 psi pressure rating unless otherwise shown or specified. Ductile iron fittings to PVC pipe shall be adequately supported on a firm trench foundation. Ductile iron fittings and specials shall be cement mortar lined (standard thickness) in accordance with ANSI A21.4.

Mechanical restraining systems (i.e. mega-lug, grip-ring) shall not be used on PVC pipe.

TRACING WIRE

For the purpose of locating non-metallic pipes, a continuous "detectable" tracing wire shall be installed. The wire shall be a minimum 12 gauge, single strand, coated copper or copper clad steel wire that is suitable for underground use. Splices shall be accomplished utilizing a corrosion proof wire connector. The connectors shall "lock" the wires in place and contain a dielectric sealant to prevent corrosion. The connector shall be the "Snake Bite" connector manufactured by Copperhead Industries, LLC, or approved equal. The wire shall be buried continuously along the pipe. The wire shall be secured into valve boxes such that a direct/conductive metal detector may be used to trace the pipe location. Bolts shall be used to secure the wire and the attachment location shall be readily available from finished grade without special equipment.

POLYETHYLENE PLASTIC WATER TUBING

Polyethylene (PE) plastic water tubing shall be installed in accordance with PWC standard details. All services installed in new construction shall be one continuous run of pipe with no splices from the corporation stop to the meter. The PE water tubing shall meet the requirements of ASTM D2737, AWWA C901, and NSF Standards 14 and 61. Pipe dimensions shall meet Iron Pipe Size (IPS) standards.

The PE tubing material shall be high density polyethylene conforming to the minimum requirements of cell classification 445574E, as defined and described in ASTM D3350. The resin shall have a material designation code of PE4710 by the Plastic Pipe Institute. The PE water tubing shall be SIDR 7, with a minimum pressure rating of 250 psi. Fittings for the PE water pipe shall be cast brass compression fittings, made to the PE water pipe dimension. All brass fittings shall have a 300 psi minimum pressure rating.

For the purpose of locating plastic water services during trenching, a continuous tracing wire shall be installed. The wire shall be a minimum 12 gauge, single strand, coated copper or copper clad steel wire that is suitable for underground use. The wire shall be buried along the water service lateral from the main to the meter box. The wire shall extend a minimum of 12 inches into the meter boxes.

COPPER WATER TUBING

Copper water tubing shall be installed in accordance with PWC standards. All services installed shall be one continuous run of pipe with no splices from the corporation stop to the meter.

Copper water tubing shall be Type K, soft copper manufactured in accordance with ASTM B88. The minimum pressure rating for the copper water pipe shall be 655 psi. Fittings for the copper water pipe shall be brass compression fittings, made to the copper water pipe dimensions. All brass fittings shall have a 300 psi minimum pressure rating.

TAPPING SLEEVES

Tapping sleeves shall be ductile iron mechanical joint or stainless steel and have a minimum working pressure of 150 psi for all tapping of mains up to and including 24-inch diameter with a branch less than or equal to 12-inches diameter. Branch diameter greater than 12-inches on a 16-inch diameter pipe and larger shall require full body ductile iron mechanical joint tapping sleeve.

Ductile iron mechanical joint tapping sleeves shall be as manufactured by Clow, M&H, Mueller, American, or an approved equal and shall be furnished with complete joint accessories. The mechanical joint sleeve shall be compatible with type and class of pipe being tapped. The outlet flange shall be class 125 per ANSI B16.1 compatible with approved tapping valves.

Stainless steel tapping sleeves shall be as manufactured by Romac, Smith-Blair, or approved equal, and shall be furnished with all accessories. The sleeve, lugs, bolts and nuts shall be 18-8 type 304 stainless steel, as provided by the manufacturer. The outlet flange shall be ductile iron or stainless steel. The gasket shall be a grid pattern design and shall provide full circumferential sealing around pipe to be tapped. The sleeve shall include a 3/4 NPT test plug. All welds shall be passivated. The outlet flange shall be class D per AWWA C-207-ANSI 150 lb. drilling compatible with approved tapping sleeves.

The tapping sleeve and valve shall be in accordance with PWC standard details.

All tapping sleeves shall be hydrostatically pressure tested prior to the tap being accomplished. **Use of air to complete the pressure test is not acceptable.** The tapping sleeve shall be tested to 150 psi. The PWC Project Coordinator shall witness and approve the testing.

WATER SERVICE SADDLES

All water service saddles for use on two (2) inch PVC shall be one (1) inch brass saddles as manufactured by Ford, McDonald, or Mueller.

Water service saddles for one (1) and two (2) inch taps on four (4), six (6), eight (8), 12-inch and larger size PVC and asbestos-cement (AC) and also four (4) inch and larger size iron pipe shall be ductile iron with stainless steel strap(s), bolts, nuts and washers. Ford Models FS 101, FS 202; Romac Models 101S, 202S; or Smith-Blair Model 315.317 shall be used. Stainless steel straps must be pre-formed at the factory to the specified outside diameters of the pipe.

Water service saddles with a two (2) inch outlet shall be double strap.

Water service saddles for pipe sizes 12-inch through 24-inch shall be double strap.

Water service saddles for pipe sizes exceeding 24-inches shall be as specified by the PWC Water Resources Engineering Department.

INSTALLATION

GENERAL

Pipe installation shall be in strict accordance with Specification Section 02222 – Excavation and Backfilling for Utility Systems and as outlined herein.

PIPE INSTALLATION

Pipe installation shall be in accordance with the manufacturer's instructions. All pipes and fittings shall be handled to prevent damage to the protective coatings and linings.

All dust, dirt, oil, tar, or other foreign matter shall be cleaned from the jointing surfaces, and shall be lubricated with lubricant recommended by the manufacturer.

All pipe shall be installed in accordance with the approved drawings and cut sheets, unless otherwise directed by PWC.

All dead ends on new mains shall have a two (2) inch blow-off assembly as indicated on the approved drawings. The blow-off assembly shall be in accordance with PWC standard details.

For pipe sizes up to 12-inches, mechanical equipment should not be utilized to assemble the pipe. For pipe sizes over 12-inches, mechanical equipment may be utilized, in accordance with the pipe manufacturer's instructions. Any damage resulting from the use of mechanical equipment shall be replaced as directed by PWC.

Adjustments in grade by exerting force on the barrel of the pipe with excavating equipment shall not be allowed. The Contractor shall verify line and grade after assembling each joint.

When pipe installation is not in progress, the open ends of the pipe shall be closed by a water tight plug or other means approved by the PWC Project Coordinator. If water is present, the plug shall remain in place until the water is lowered to a level that allows for proper installation. No pipe shall be laid in water or where in the PWC Project Engineer's and/or PWC Project Coordinator's opinion trench conditions are unsuitable. Every precaution shall be taken to prevent material from entering the pipe while it is being installed.

ALIGNMENT AND GRADE

The Contractor shall be responsible for installing the pipe and appurtenances to proper line and grade.

All ductile iron pipe and fittings shall be installed in accordance with ANSI/AWWA C-110/A21.10. All C-900 pipe shall be installed in accordance with ASTM D-2774. The amount of deflection in the PVC or ductile iron pipe shall not exceed the applicable AWWA standards and the

manufacturer's recommendations. If the required deflection exceeds the specified limitations or as determined by the Public Works Commission, mechanical joint bends shall be utilized.

Pipe passing through walls of NCDOT bridges, retaining walls, and other concrete structures shall be factory restrained joint ductile iron and be installed in casings/sleeves in accordance with NCDOT specifications. Annular space between walls and sleeves shall be filled with an approved cement mortar that meets NCDOT specifications. The annular space between the sleeve and the pipe shall be filled with an approved mastic.

Pipe passing through the walls of meter vaults, valve pits, and storm drainage structures shall be restrained joint ductile iron, as specified by PWC. Pipe shall be installed in a casing/sleeve if determined to be necessary. Annular space between walls and sleeves shall be filled with an approved cement mortar. Annular space between pipe and sleeves shall be filled with an approved mastic. Proposed conflict boxes with storm and water shall be reviewed by the PWC Water Resources Engineer and approved on a case by case basis.

All ductile iron pipe (regardless of diameter) within casings shall be factory restrained, in accordance with these specifications and the applicable PWC standard details. The use of mechanical restraints (i.e., mega-lugs, grip-rings, etc.) shall not be utilized on pipe within casings.

When pipe is field cut, the cut end shall be smooth and at right angles to the axis of the pipe. All sharp edges shall be removed. All field cut pipe shall be beveled. The beveled end of PVC pipe shall be removed, when installing into mechanical joint ductile iron fittings.

When connecting unlike (class, material, etc.) pipe, an approved PWC fitting shall be used. All pipe shall be installed in accordance with AWWA C-600 or C-605 as applicable, for buried lines and the manufacturer's recommendations. For mechanical joint pipe and fittings, all nuts shall be torqued to the manufacturer's recommendations.

Concrete thrust blocking shall be utilized on all PVC water mains. The concrete thrust blocking shall be in accordance with PWC standard details. When thrust blocking is to be utilized, backfilling shall not occur until the concrete has time to set. No hydrostatic pressure testing shall occur until the concrete thrust blocking has cured for a minimum of five (5) calendar days.

FIRE HYDRANTS

Fire hydrants shall be installed as shown on the approved drawings. Each fire hydrant shall be connected to the main with a six (6) inch branch line and shall have a minimum of 42-inches of cover. Fittings between the valve and fire hydrant may be utilized, with prior approval from PWC. The valve shall be located at the main unless otherwise approved by PWC. Hydrants shall be set plumb with pumper nozzle facing the roadway. The hydrant branch shall not be backfilled until inspected and approved by the PWC Project Coordinator. Fire hydrants shall be installed in accordance with PWC standard details.

HYDROSTATIC TESTS

All mains and laterals shall be subjected to a hydrostatic pressure test. Each valved section maybe tested individually.

The Contractor shall furnish all labor and material, including test pumps, taps, and corporations, necessary to complete the work. Any taps which are not to be utilized shall be killed out at the main. If any taps are to be used for irrigation laterals they shall be installed in accordance with PWC standard details. A PWC Project Coordinator shall be present and observe all valve operation by the Contractor. Under no circumstances shall a Contractor operate any PWC-owned valves unless it is an emergency.

The duration of the pressure test shall be at least one hour or longer, as directed by the PWC Project Coordinator. The hydrostatic pressure shall be 200 psi. The pipe to be tested shall be slowly filled with water and the specified test pressure shall be applied. Before applying the specified test pressure, all air shall be expelled from the pipe. If hydrants or blow offs are not located to properly expel the air, taps shall be made as approved by PWC.

Damaged or defective materials discovered as a result of the pressure test shall be removed and replaced with new material, and the test shall be repeated until the test results are satisfactory to the Public Works Commission.

All replacement, repair or retesting shall be accomplished by the Contractor at no additional cost to the Public Works Commission. All repairs shall be reviewed and approved by PWC prior to backfill. The use of couplings, fittings, sleeves, etc. shall be reviewed and approved by PWC prior to use. The main must successfully pass the hydrostatic test prior to sterilization.

STERILIZATION

Sterilization shall be in accordance with the requirements of NCDEQ, the North Carolina Rules Governing Public Water Supply, AWWA C651, and AWWA C655 (most recent editions). The Contractor shall furnish all chlorinating equipment, sterilization solution, materials, excavation, barricades, backfilling, and any taps and corporations necessary to complete the work. The Contractor shall fully cooperate with the PWC Project Coordinator, furnish any needed assistance, and schedule the testing.

Prior to performing the hydrostatic test, water mains, laterals, and appurtenances shall be flushed to remove air, sediment, contaminants, and/or foreign matter. After completion of a successful hydrostatic test, the water system shall be disinfected by the thorough dispersion of a chlorine solution. The chlorine level shall be between 50 parts per million (ppm) and 100 ppm throughout the water system. In no case shall the chlorine level exceed 300 ppm. If the chlorine level is over 300 ppm, the system shall be completely flushed and re-chlorinated. **In no case shall chlorine be introduced into the water system in a dry solid state.**

The chlorine solution shall remain in contact with the interior surfaces of the water system for a minimum period of 24 hours and shall result in not less than 10 ppm of chlorine throughout the system. Then the water system shall be flushed with water from the existing PWC water system until the chlorine solution is dispelled. The Contractor shall take all necessary measures to prevent downstream erosion caused by flushing the lines. All erosion/damages shall be repaired at no additional expense to the Public Works Commission. All environmental regulations governing the release and/or disposal of chlorinated testing water shall be met by the Contractor. AWWA C655 defines "highly chlorinated" water as water having more than four (4) ppm. Any water with a chlorine level greater than four (4) ppm shall be de-chlorinated by the Contractor prior to being released to the environment.

If any disruption to the disinfection process occurs, or if any repair procedure is necessary then the disinfection process shall start over.

After disinfection, the water supply shall not be accepted or placed into service until bacteriological tests results or representative water samples analyzed in the Public Works Commission's laboratory are found to be satisfactory. The disinfection shall be repeated until tests indicate the absence of pollution for at least two (2) full days. The PWC Project Coordinator shall be responsible for taking the sample(s) and transporting them to the PWC laboratory.

If the initial sample taken after disinfection and flushing does not indicate that the water main is sterilized, the Contractor shall, in conjunction with the PWC Project Coordinator, flush the lines. Once flushing is complete, another sample will be taken to the Public Works Commission's laboratory for analysis. Should this second sample also fail to indicate that the main is sterilized; the Contractor shall repeat the disinfection process. This process shall be repeated until the samples are satisfactory. The Contractor shall fully cooperate with the PWC Project Coordinator, furnish any needed assistance, and schedule the testing.

END OF SECTION

**DIVISION 2
SITE WORK
02662 – FIRE HYDRANT PAINTING**

GENERAL

The object of these specifications is to provide the material and workmanship necessary to produce a first class job.

The Contractor shall paint all exposed exterior fire hydrant surfaces. Minor items not specifically specified, but necessary for proper completion of the work, shall be painted as directed by the Owner.

Painting shall be done at such times the Contractor and Engineer may agree upon in order that a dust free and neat work may be obtained. All painting shall be done in strict accordance with the paint manufacturer's recommendations and shall be satisfactory to the Engineer. Protective covering shall be utilized, as necessary and extreme care taken for protection of adjacent areas, equipment, shrubbery, or other items while painting is in progress. After painting is complete, all spilled paint drops, or other defects shall be removed from surfaces and the entire area thoroughly cleaned up. The Contractor shall submit to the Engineer, upon completion of the painting, certification from the paint manufacturer indicating that the quantity of paint, purchased for each item, was sufficient to properly coat all surfaces.

PAINT

All paint materials shall be first quality and shall be delivered on the job in the original sealed containers bearing the manufacturer's name and trademark. Paint shall conform to the requirements of Federal Spec. TT-V-51 or Military Spec. MIL-C450 or equal. The prime coat from the ground line up shall conform to Federal Spec. TT-P-86 (Type IV), Federal Spec. TT-P-636 or equal.

Thinners: Where thinning is necessary, only the products of the manufacturer furnishing the paint, and for the particular purpose, shall be allowed and all such thinning shall be done strictly in accordance with the manufacturer's instructions as well as with the full knowledge and approval of the Engineer.

SURFACE PREPARATION

All surfaces to be painted shall be prepared in a workman-like manner with the objective of obtaining a smooth, clean and dry surface. All painted surfaces shall be prepared and finished in accordance with the following specifications and shall be approved by the Engineer.

Metal: All exposed surfaces of fire hydrant and other ferrous metal items generally are to be shop primed and shall have all rust, scale, dust, grease or other deleterious substances removed by sandblasting or pickling in accordance with SSPC-SP-6. Cleaned metal shall be immediately primed to prevent new rusting. All ferrous metal items, not shop primed, shall be field cleaned by wire brushing (if approved by the Engineer) or sandblasting and immediately primed. Non-ferrous metals shall be solvent cleaned just prior to the application of prime coat or pre-treatment. Equipment not shop finished to the Engineer's satisfaction shall also be painted.

Application: Paint shall be applied evenly. Where necessary to obtain a smooth finish, the surface shall be sanded after application of the prime coat. Paint shall be applied, for each coat, at the rate specified by the manufacturer. Any difficulties in film thickness shall be corrected by the application of additional coats until the recommended thickness is obtained. If material has thickened or must be diluted for application by a spray gun, the coating shall be built-up to the same film thickness achieved with un diluted material. Additional coats of paint shall not be applied nor shall units be returned to service until paints are thoroughly dry. Paint shall not be applied in rain or damp weather or when the temperature is lower than 50°F. Painting shall be suspended when relative humidity exceeds 85% or when air temperature will drop to below 40°F within 18 hours of application.

PAINTING SCHEDULE

Schedule of colors and coating requirements are as follows: Acceptable dry mil thickness will be 4-6 for each coat. Bonnet of hydrant shall be Acrylic Enamel, Dark Green paint or approved equal. Fire hydrant barrel, caps, chain and other exterior surfaces shall be Quick Drying Acrylic Enamel Yellow Paint or approved equal.

*** END OF SECTION ***

**DIVISION 2
SITE WORK
02730 - SANITARY SEWER SYSTEMS**

GENERAL

Sanitary sewer lines and all appurtenant items shall be constructed of materials specified or indicated on the drawings. The intent and purpose of these specifications is to require a complete and satisfactory installation in every respect and any defect in material or workmanship shall be cause for the replacement and correction of such defect as directed by the Public Works Commission.

RELATED SECTIONS

- A. 02211 – Grading, Utilities
- B. 02222 – Excavation and Backfilling for Utility Systems
- C. 02732 – Sewage Force Mains

MATERIALS

SEWER MAINS

Prior to shipment each joint of pipe shall be stamped by an independent testing laboratory, certifying compliance with the specifications stated therein. Pipe sizes indicated shall be understood to be nominal inside diameter of the pipe. All sewer pipe materials shall be either PVC (as specified herein) or ductile iron (as specified herein), unless otherwise approved in writing by the Public Works Commission. Written approval shall be obtained prior to installation.

DUCTILE IRON PIPE

The raw material from all ductile iron pipe and fittings shall have an average minimum content consisting of 90% recycled iron and steel. Ductile iron pipe and fittings shall be manufactured in the United States of America in accordance with ANSI/AWWA A21.51/C151. The manufacturer of the ductile iron pipe shall be a member of the Ductile Iron Pipe Research Association (DIPRA).

All ductile iron pipe and fittings shall be in strict accordance with ANSI A21.51 and AWWA C151, Class 50 or Class 51, as applicable, in every respect. The working pressure shall be a minimum of 200 psi. Pipe shall be furnished in 18 or 20-foot lengths. All pipe joints used in open trench construction shall be furnished with "push-on" joints, unless otherwise indicated on the drawings or specified. All joints and fittings shall be in accordance with ANSI A21.11 and AWWA C111. All ductile iron interior surfaces shall be lined with two (2) coats of ceramic epoxy to produce a total minimum dry film thickness of 40 mils (Protecto401 or approved equal). The exterior pipe surfaces shall be protected with asphaltic coating as specified in AWWA C151 and C110. Specifications for the ceramic epoxy can be found in Specification Section 09802.

For aerial crossings which are 4 inches through 12 inches in diameter, manufactured restrained joint ductile iron pipe Class 53, or Class 53 flanged ductile iron pipe shall be utilized in accordance with the standard Public Works Commission detail for aerial crossings. Mega-lugs, field-lok, and gripper rings are not an allowable means of restraint for aerial crossings. For aerial crossings

larger than 12 inches, or as noted specifically on the plans, flange joint ductile iron pipe, Class 53, shall be utilized in accordance with the standard Public Works Commission details. The location of flanges shall be specifically designed for each application. The flange pipe shall be in accordance with ANSI/AWWA C-115/A21.15. Threads for threaded flange pipe shall be in accordance with ANSI B2.1, shop fabricated as outlined by AWWA 115 with serrated faces furnished on the pipe, completely factory installed. Welding of flanges to the body of the pipe will not be acceptable. Ductile iron fittings and flanges shall be in accordance with ANSI/AWWA C-110/A21.10 with a minimum working pressure of 250 psi. Gaskets shall be full faced SBR rubber per ANSI/AWWA C-111/A21.11 with a minimum 1/8" thickness. Linings and coatings shall be as outlined for ductile iron pipe.

If the Public Works Commission determines that an expansion coupling is required, it shall be installed as indicated on the drawings. The expansion coupling shall not be buried.

For subsurface water crossings (i.e., streams, wetlands), restrained joint ductile iron pipe shall be utilized. No mechanical restraint systems (e.g., mega-lugs, field-lok gaskets, etc.) shall be utilized. The pipe shall be installed in a casing, in accordance with the approved Public Works Commission detail, unless otherwise specifically approved by the Public Works Commission.

PVC PIPE

PVC sewer pipe and fittings 4 inches thru 15 inches shall be in accordance with ASTM D-3034 with a standard dimension ratio (SDR) of 26 for sewer mains and laterals. Larger diameter pipe (18 inches through 27 inches) shall be in accordance with ASTM F-679, with a SDR of 26. Both pipe and fittings shall be made of PVC plastic having a cell classification of 12454 as specified in ASTM D-1784.

Pipe joining shall be push on elastomeric gasket joints only and the joints shall be manufactured and assembled in accordance with ASTM D-3212. Elastomeric seals shall meet the requirements of ASTM F-477. The pipe shall be furnished with integral bells and with gaskets that are permanently installed at the factory and in accordance with ASTM D-3212 and contain a steel reinforcing ring. PVC sewer pipe shall be made by continuous extrusion of prime green unplasticized PVC and contain identification markings as required by the applicable ASTM standard.

SEWER FITTINGS

Ductile Iron Push-on Fittings:

Ductile iron sewer fittings on PVC mains shall be deep bell, gasketed joint, and air test rated. Gasket grooves shall be machined in the factory. Material shall be ductile iron, in accordance with ASTM A536, Grade 65-45-12 and ASTM F1336. Wall thickness shall meet the requirements of AWWA C153. Gaskets shall have a minimum cross sectional area of 0.20 square inches, and conform to ASTM F477. All ductile iron fittings shall have an interior coating of Protecto 401, or approved equal. All ductile iron fittings on PVC pipe shall provide a flow line that provides a smooth transition between the materials. Ductile iron fittings shall be as manufactured by the Harrington Corporation (Harco), or approved equal.

Mechanical Joint Fittings:

Joints shall be installed in accordance with AWWA C-600 and shall conform to AWWA Standard C-111. Mechanical joints shall be of the stuffing box type and shall conform to ANSI A21.11 for four inch (4") pipe and larger. Fittings and specials shall be ductile iron and shall be manufactured in accordance with AWWA Standard C-110 (ANSI A21.11). Compact fittings shall be ductile iron in accordance with ANSI A 21.53 (AWWA C-153) for 4" thru 24" sizes only. Note: mechanical joint wyes are not included in the AWWA C-153 specification. Pressure rating shall be not less than 200 psi unless otherwise specified. All ductile iron fittings shall have an interior coating of Protecto 401, or approved equal. Mechanical joint fittings shall be utilized on ductile iron mains and ductile iron laterals. Mechanical joint fittings shall not be utilized on PVC mains, unless otherwise approved by the Public Works Commission.

PVC Fittings:

PVC fittings shall be manufactured in accordance with ASTM D-3034, F-1336, and F-679. Molded fittings shall be utilized in sizes from 4" to 8" (or larger, if available). Fabricated fittings shall only be utilized with prior approval from the Public Works Commission. Fabricated fittings are defined as those fittings that are made from pipe or a combination of pipe and molded components. All PVC fittings shall contain identification markings as required by the applicable ASTM standard. All PVC fittings shall be gasketed joint, except as indicated for interior drop structures. Plastic fittings shall be as manufactured by GPK Products, Inc., Plasti-Trends, the Harrington Corporation (Harco), or approved equal.

Ductile Iron Pipe Size x SDR26 Transition Adapter:

All ductile iron x PVC transition adapters shall be one (1) piece, bell x bell (gasket x gasket). Transition adapters shall range in size from four (4) inches through 12 inches. Transition adapters for pipe larger than 12-inches shall be as specified by the Public Works Commission. All transition adapters shall have a flow way tapered to allow a smooth transition between the ductile iron and PVC. Transition adapters shall be either PVC or ductile iron, in accordance with the following:

PVC – All PVC transition fittings shall be made from DR 18 C900 pipe stock. The C900 pipe stock shall meet the requirements of AWWA C900/C905, and have a minimum cell classification of 12454 as defined in ASTM D1784. The wall thickness shall meet or exceed DR 18. PVC transition fittings shall have SBR gaskets in accordance with ASTM F477. All six (6) inch and eight (8) inch adapters shall be molded. Molded fitting joints shall be 235 psi rated, in accordance with ASTM D3139, and shall have SBR rubber gaskets. Four (4) inch, ten (10) inch and 12 inch transition adapters shall have SBR Rieber style gaskets meeting ASTM F477. Joints shall be 235 psi rated, in accordance with ASTM D3139 for the C900 (ductile iron) bell, and in accordance with ASTM D3212 for the sewer (SRD26) bell. Molded C900 bell depths shall comply with AWWA C907. Fabricated (4-inch, 10-inch and 12-inch) bell depths and molded sewer (SDR26) bell depths shall be in accordance with ASTM F1336. PVC transition adapters shall be manufactured by the Harrington Corporation (Harco), GPK Products, or approved equal.

Ductile iron – Ductile iron transition fittings shall be deep bell, push-on joint, and air test rated. The ductile iron material shall comply with ASTM A536, Grade 65-45-12 or 80-55-06. The bell depth shall be in accordance with ASTM F1336. Gaskets shall be of SBR rubber, in accordance with ASTM F477. Transition gaskets are not allowed. All ductile iron transition fittings shall have

an interior coating of Protecto401 or approved equal. Ductile iron transition fittings shall be manufactured by the Harrington Corporation (Harco) or approved equal.

Saddles:

Sewer service saddles may be utilized for sewer lateral installations. All sewer service saddles shall be ductile iron with stainless steel straps, bolts, nuts, and washers. The nuts shall be coated to prevent galling. The saddle body shall be ductile iron, in accordance with ASTM A536, Grade 65-45-12. The gasket material shall be SBR, in accordance with ASTM D2000. Saddles for PVC or DI laterals shall have an alignment flange. Sewer service saddles shall be as manufactured by Geneco, or approved equal. All stainless steel straps shall be pre-formed at the factory, to the specified outside diameters of the pipe.

SEWER LATERALS

Ductile iron laterals – For ductile iron mains, utilize mechanical joint fittings or an approved saddle with an alignment flange (Geneco or approved equal). For PVC mains, utilize an approved saddle with an alignment flange (Geneco or approved equal) or ductile iron fittings as specified above.

PVC laterals – utilize a saddle with an alignment flange (Geneco or approved equal) on PVC or ductile iron mains; utilize a mechanical joint tee with SDR 35 transition gaskets on ductile iron mains; or utilize PVC fittings as specified above on PVC mains.

The following table summarizes the materials to be utilized for sewer main to lateral connections:

	PVC Main	DI Main
DI Lateral	DI fitting or approved saddle	MJ fitting or approved saddle
PVC Lateral	PVC fitting or approved saddle	MJ fitting with transition gasket or approved saddle

Sewer laterals shall be in accordance with these Specifications and PWC standard details S.10, S.11, and S.12.

PRECAST CONCRETE MANHOLES

Pre-cast circular reinforced concrete manhole units shall be in accordance with ASTM C-478. The tongue and groove ends of the manhole sections shall be manufactured for jointing with rubber gaskets (i.e., con-seal). An eccentric cone shall be utilized on all manholes, unless otherwise approved by the Public Works Commission.

Manhole steps shall be placed in all manholes and shall be steel reinforced (½" grade 60) copolymer polypropylene plastic steps in accordance with ASTM C-478 for material and design. The steps shall be spaced 16" on center with serrated treads and wide enough to stand on with both feet.

Manhole frames and covers shall be made of gray cast-iron, and the iron shall possess a tensile strength of not less than 18,000 psi. Cast iron shall conform to ASTM Specification A 48-83 Class 35. The frame and cover shall be manufactured by the same manufacturer. All castings shall be

in accordance with Public Works Commission standard details. Any defective castings shall be removed and replaced.

Any special linings and coatings that are specified for a manhole and installed at the production facility, in the field, or during repairs, shall be applied in accordance with the applicable special coatings specification and the manufacturer's specifications for that material.

Camlock ring and covers shall be in accordance with Public Works Commission standard details. Camlock bolt head shall be compatible with PWC standard tool for turning camlock mechanism. Camlock ring and covers shall be installed as indicated on the drawings, in accordance with PWC standard details.

SELECT BEDDING MATERIAL

Select bedding material shall be crushed stone (No. 57 or No. 5), in accordance with Public Works Commission standard details. Bedding material shall be provided for all pipe materials.

INSTALLATION

Pipe installation shall be in strict accordance with Specification Section 02222 – Excavation and Backfilling for Utility Systems and as outlined herein.

PIPE LAYING

Pipe installation shall be in accordance with the manufacturer's instructions. Proper equipment shall be utilized to perform the work in a manner satisfactory to PWC. All pipes and fittings shall be carefully lowered into the trench in such a manner to prevent damage to the protective coatings and linings. Under no circumstances shall pipe materials be dropped or dumped into the trench. Pipe shall be carried into position and not dragged.

All dust, dirt, oil, tar (other than standard coating), or other foreign matter shall be cleaned from the jointing surfaces, and the gasket, bell, and spigot shall be lubricated with lubricant recommended by the manufacturer.

The pipe shall be laid upgrade, beginning at the lower end with the tongue or spigot ends pointing in the direction of the flow to the correct line and grade, unless otherwise approved by PWC. The pipe section to be installed shall be aligned by batter board or laser beam with the last installed pipe section. Mechanical equipment should not be used to assemble the pipe. Pipe shall be assembled in accordance with the pipe manufacturer's instructions. Any damage resulting from the use of mechanical equipment shall be replaced as directed by PWC.

Adjustments in grade by exerting force on the barrel of the pipe with excavating equipment shall not be allowed. The Contractor shall verify line and grade after assembling each joint.

At any time when pipe laying is not in progress, the open ends of the pipe shall be closed by a water tight plug or other means approved by the PWC Project Coordinator. If water is in the trench, the plug shall remain in place until the trench is pumped completely dry. No pipe shall be laid in water or where in the PWC Project Engineer's and/or PWC Project Coordinator's opinion

trench conditions are unsuitable. Every precaution shall be taken to prevent material from entering the pipe while it is being installed.

ALIGNMENT AND GRADE

All pipe shall be installed to the required lines and grades. Structures shall be installed at the required locations. The lines and grades of the pipe will generally be indicated by stakes parallel to the line of the pipe. The Contractor shall be responsible for installing the pipe to proper line and grade.

Pipe shall be visually inspected by shining a light between structures and /or by closed circuit television inspection. Any defects discovered, including poor alignment, shall be corrected as directed by the Public Works Commission.

The bottom of the trench shall be excavated to a minimum of four inches (4") below the outside bottom of the pipe being installed to allow adequate placement and compaction of bedding material prior to installation.

Select bedding material shall be placed a minimum of four inches (4") and a maximum of six inches (6") under the pipe for full width of the trench and halfway up the pipe on the sides. Bedding material shall be placed in layers not exceeding six inches (6") loose thickness for compacting by vibratory mechanical tamps under the haunches and concurrently on each side of the pipe for the full width of the trench. The final result shall be "Class B" bedding for rigid pipe. If the existing material under the pipe bedding material is unsuitable, the unsuitable material shall be removed and replaced with select bedding material (No. 57 or No. 5 stone), as authorized and approved by the Public Works Commission Project Coordinator.

The same material pipe shall be utilized from manhole to manhole, unless otherwise approved by PWC. If the section of pipe between manholes is 250 feet or less, no transitions will be allowed (either all PVC or all ductile iron). Should the length between manholes exceed 250 feet, only one transition will be allowed. Use of a C900 x SDR 26 adaptor shall be used to accomplish the transition. A transition is defined as the use of one C900 x SDR26 adaptor. No more than one (1) adaptor shall be utilized in any given manhole to manhole segment.

All manholes shall be constructed to Public Works Commission's standards. Installation shall be in accordance with ASTM C-891 and PWC standards.

Manholes shall be constructed of precast reinforced concrete circular sections installed on a base riser section with integral floor and shall be cored to accommodate the various pipe connections, as indicated on the drawings. Pipe connections to a manhole shall be by gasketed flexible watertight connections (boot for small diameter and A Loc for larger diameter pipe) or as approved by the Public Works Commission. The manhole size shall be in accordance with the following table, unless otherwise specified:

<u>Pipe Size</u>	<u>Manhole Diameter</u> **
24" and less	48" *
27" - 36"	60"
42"	72"

* Where interior drop structures are required, use 60" diameter as required in the Public Works Commission standard details.

** Where multiple connections or acute angles are required, larger diameter manhole may be required as indicated on the plans.

The invert channel shall be constructed of brick and mortar, in accordance with Public Works Commission standard details. **Precast inverts are not allowed.** The invert channel shall be smooth and semicircular in shape conforming to the inside of the connecting sewer section. Changes in direction of flow shall be made with a smooth curve as large as a radius as the size of the manhole will permit without a decrease in flow velocity. Changes in size and grade of the channel shall be made gradually and evenly. The invert channel walls shall be constructed to three quarters (3/4) of the height of the crown of the outlet sewer and in such a manner not to obstruct maintenance, inspection or flow in the sewers. The inverts shall have a minimum slope of one (1) percent across the bottom of the manhole. A shelf shall be provided on each side of any manhole invert channel. Inverts in manholes with standing water will not be acceptable. The shelf shall be sloped not less than 1:12 (min) and no more than 2:12 (max). The bottom of the boot for the new sewer main or lateral shall be set one inch above existing shelf unless otherwise indicated.

When used in a paved street, the ring and cover shall be set in suitable mortar surrounded by a concrete collar in accordance with Public Works Commission standard details. When used in places other than in a paved street, the ring and cover shall be set to the grade shown on the plans or directed by the Public Works Commission. In unpaved areas cam-lock ring and cover shall be used. Camlock ring and cover shall be installed in accordance with Public Works Commission standard details.

The interior manhole riser joints, lift holes and grade adjustment rings shall be sealed with non-shrinking mortar to provide a watertight manhole. Lift holes sealed by the manufacturer with plastic caps do not require mortar seal. The hardened mortar shall be smooth to rub with no sharp edges. Use of grade rings with cam-lock ring and cover are not allowed, unless approved by the PWC Project Coordinator. **Use of grade rings is not allowed for above grade adjustments.**

All exterior manhole riser joints, including the joint at the cone, shall be sealed with an external rubber sleeve. The sleeve shall be made of stretchable, self-shrinking rubber, with a minimum thickness of 30 mils. The back side of each wrap shall be coated with a cross-linked reinforced butyl adhesive. The butyl adhesive shall be a non-hardening sealant, with a minimum thickness of 30 mils. The seal shall be designed to stretch around the manhole joint and then overlap to create a fused bond between the rubber and butyl adhesive. The application shall form a continuous rubber seal for the life of the application. The sealing system shall be as manufactured by Concrete Sealants, Inc. (Con-Seal), Sealing Systems, Inc., or approved equal. The wrap shall be a minimum of six (6) inches in width, and shall be centered on the joint. All manhole joints (including the cone section to the last riser) shall be wrapped and sealed. Care shall be taken to prevent damage to the wrap during backfill operations. The manhole surface shall be prepared in accordance with manufacturer's specifications, prior to installing the joint wrap.

Materials shall not enter the sewer line during construction of the manhole. The manhole shall be kept clean of any and all debris or materials. Any debris or material that entered the manhole shall be immediately removed. This condition shall be maintained until final acceptance of the work.

CONNECTION TO EXISTING MANHOLES OR LIFT STATIONS

All connections to existing manholes and/or lift stations shall be approved by the Public Works Commission. Where new mains are to be connected to existing active sanitary sewers, the active sewers shall remain in service. Unless otherwise indicated, where new lines are connected into existing manholes, all or such portion of the manhole invert as is necessary shall be removed and a new invert shall be constructed to accommodate both new and existing flows. All work shall conform to the requirements specified for new manholes. The existing structure connection shall be cored and a flexible watertight connection (i.e., boot) installed. The boot shall be installed in accordance with Public Works Commission standard details and requirements. The Contractor shall coordinate and cooperate with the Public Works Commission's Project Coordinator.

PIPE TO MANHOLE CONNECTOR (BOOT)

A watertight, flexible pipe-to-manhole connector shall be utilized on all pipe to manhole connections, for both new and existing manholes and pipes, unless otherwise specifically authorized in writing by the Public Works Commission.

The connector assembly shall be the sole element to provide a watertight seal of the pipe to the manhole or other structure. The connector shall consist of a rubber gasket, an internal compression sleeve, and one or more external take-up clamps. The connector shall consist of natural or synthetic rubber and Series 300 non-magnetic stainless steel. No plastic components shall be allowed.

The rubber gasket shall be constructed of synthetic or natural rubber, and shall meet or exceed the requirements of ASTM C-923. The connector shall have a minimum tensile strength of 1,600 psi. The minimum cross-sectional thickness shall be 0.275 inches.

The internal expansion sleeve shall be comprised of Series 300 non-magnetic stainless steel. No welds shall be utilized in its construction.

Installation of the connector shall be performed utilizing a calibrated installation tool furnished by the connector manufacturer. Installation shall require no re-tightening after the initial installation. Installation shall be done in accordance with the manufacturer's instructions.

The external compression take-up clamps shall be Series 300 non-magnetic stainless steel. No welds shall be utilized in its construction. The clamps shall be installed utilizing a torque-setting wrench furnished by the connector manufacturer. Installation shall be done in accordance with the manufacturer's instructions.

The Contractor shall utilize the proper size connector in accordance with the connector manufacturer's recommendations. All dead-end pipe stubs shall be restrained in accordance with ASTM C-923.

The finished connection shall provide a sealing to a minimum of 13 psi, and shall accommodate a minimum pipe deflection of seven (7) degrees without the loss of seal.

The pipe to manhole connector shall be PSX: Direct Drive as manufactured by Press-Seal, or approved equal.

INSIDE DROP MANHOLE STRUCTURE

Inside manhole drop structures shall be constructed and installed in accordance with Public Works Commission standard details.

CLEANING

Prior to final inspection, all sanitary sewer laterals, mains, and manholes newly installed on the collection system shall be flushed and cleaned. During the flushing operation, the downstream manhole shall be closed with a watertight plug to protect the existing sewer main. All water and debris shall be removed and properly disposed of by the Contractor. This condition shall be maintained until the Public Works Commission issues final acceptance for the project.

TESTING

Completed sewers shall be tested in accordance with the provisions outlined below. The Contractor shall furnish all equipment, labor, materials, and pay all costs associated with the tests performed. The Contractor shall schedule all testing with the Public Works Commission's Project Coordinator, a minimum of 48 hours in advance. The Contractor shall cooperate with the Public Works Commission's Project Coordinator and furnish any needed assistance necessary to complete the required testing.

For annexation and/or retrofit projects: No testing shall be conducted prior to successful completion of the compaction testing.

For all other projects: No testing shall be completed until all utilities are installed, prior to preparation of the road subgrade. The Contractor may elect to perform testing to satisfy them that the sewer utility is installed properly prior to commencing installation of other utilities. However, such testing shall not be construed as acceptance by PWC.

The deflection/mandrel test shall not be performed until a minimum of thirty (30) calendar days after backfill operations are completed and the area graded to final contours. In lieu of waiting thirty (30) calendar days, the Contractor has the option to have an independent testing laboratory verify that compaction has been completed to achieve the maximum density as shown in the detail. The location and elevation of the compaction testing shall be determined reviewed and approved by the Public Works Commission's Project Coordinator. The Contractor shall provide the Public Works Commission with a copy of the density testing results.

Compaction testing shall be done in accordance with Specification Section 02222 – Excavation and Backfilling for Utility Systems.

Vacuum Testing Manholes:

All precast sanitary sewer manholes installed by the Contractor shall be vacuum tested for leakage. This test shall be done in accordance with ASTM C-1244 and in the presence of a Public Works Commission Project Coordinator. The Contractor shall be responsible for providing all the necessary labor, materials, equipment, testing apparatus, and all other incidentals necessary to complete the vacuum test. All testing equipment utilized shall be approved for use in vacuum testing manholes.

Each manhole shall be tested after assembly. All lift holes shall be plugged with an approved non-shrink grout. All lines, including laterals, entering the manhole shall be temporarily plugged. The Contractor should take care to ensure that the pipes and plugs are secure in place to prevent them being drawn into the manhole. The test head shall be placed directly on top of the concrete surface of the manhole following the manufacturer's recommendations, rather than to the cast iron seating ring.

Manholes may be tested either prior to backfill or post backfill at the contractor's option. For pre-backfill testing, a vacuum of 10 inches of Mercury (inches Hg) shall be drawn on the manhole, the valve on the vacuum line of the test head closed, and the vacuum pump shut off. The time shall be measured for the vacuum to drop to 9 inches of Mercury (inches Hg). The manhole is acceptable if the time for the vacuum reading to drop from 10 inches of Mercury to 9 inches of Mercury meets or exceeds the values indicated below:

<u>Manhole Depth</u>	<u>Diameter of Manhole</u>		
	<u>4' Diameter</u>	<u>5' Diameter</u>	<u>6' Diameter</u>
10' or less	25 sec	33 sec	41 sec
11' to 15'	38 sec	49 sec	62 sec
16' to 20'	50 sec	65 sec	81 sec
21' to 25'	62 sec	82 sec	101 sec
25' to 30'	74 sec	98 sec	121 sec

Vacuum testing backfilled manholes is not recommended in the presence of groundwater. Vacuum testing a backfilled manhole that is subjected to hydrostatic pressure may exceed the design limits of the flexible connectors and could lead to failure of the structure, joints, and/or connectors. Where groundwater is present a reduction in the vacuum pressure applied to the manhole will be required. The vacuum shall be reduced by 1 inch of Mercury for every 1 foot of hydrostatic head between 12 feet and 21 feet. A vacuum test should not be performed when the hydrostatic head exceeds 22 feet. See the chart below:

Hydrostatic Head (ft)*	12	13	14	15	16	17	18	19	20	21	22
Vacuum Pressure (in Hg)	10	9	8	7	6	5	4	3	2	1	**

*Hydrostatic head above the critical connector (critical connector is bottom most flexible connector)

**Do not perform vacuum test

If the manhole fails the initial test, the manhole shall be repaired by an approved method until a satisfactory test is obtained. All repair methods shall be approved by the Public Works

Commission prior to being utilized. Retesting shall be performed until a satisfactory test is accomplished.

Mandrel Testing:

Deflection tests shall be performed on all PVC pipe installations. PVC pipe's maximum deflection after backfilling shall not exceed five (5) percent. The rigid ball or mandrel used for the deflection test shall have a diameter not less than 95 percent of the base inside diameter or average inside diameter of the pipe depending on the type of pipe manufactured and the applicable ASTM Standard. The PVC pipe shall be measured in compliance with ASTM D2122 "Standard Test Method of Determining Dimensions of Thermoplastic Pipe and Fittings". The Contractor shall supply all labor, equipment and materials necessary to perform the test in the presence of the Public Works Commission's Project Coordinator. The test shall be performed without mechanical pulling devices. The mandrel shall be constructed so as to preclude any yield in diameter, and with a pull line on each end to facilitate withdrawal. If the deflection exceeds the allowable, the Contractor shall remove and replace the pipe.

Air Testing:

Air testing shall be performed on all mains and laterals to determine acceptability. The length of sewer subject to an air test shall be the distance between two adjacent manholes. The tests shall be conducted in accordance with the appropriate ASTM standard. The air test shall be coordinated with the Public Works Commission. The Contractor is required to supply all equipment, labor, materials and pay all costs associated with the test performed.

Air Test for PVC Pipe

The low pressure air test on PVC pipe shall be performed with satisfactory results in accordance with ASTM F1417 "Standard Test Method for Installation Acceptance of Plastic Gravity Sewer Lines Using Low-Pressure Air". The pipe, including lateral assemblies, shall be plugged and air added slowly until the internal pressure of the line is raised to 4.0 psi. After the pressure of 4.0 psi is obtained, regulate the air-supply so that the pressure is maintained between 3.5 and 4.0 psi for at least two (2) minutes, depending on air/ground temperature conditions. The pressure will drop slightly until equilibrium is obtained; however, a minimum of 3.5 psi is required. Once the 3.5 psi is maintained, the test will begin. If the pressure drops 1.0 psi within the time indicated below, the test fails.

Pipe Dia (in)	Minimum time (minutes)	Length for Min Time (ft)	Time for Longer Length (sec)
4	3:46	597	0.380L
6	5:40	398	0.854L
8	7:34	298	1.520L
10	9:26	239	2.374L
12	11:20	199	3.418L
15	14:10	159	5.342L
18	17:00	133	7.692L
21	19:50	114	10.470L
24	22:40	99	13.674L

27	25:30	88	17.306L
30	28:20	80	21.366L
33	31:10	72	25.852L
36	34:00	66	30.768L

The Contractor shall observe all safety precautions to include allowing no one in the manholes during testing, securing all plugs and providing additional plug bracing. The Contractor shall be required to furnish, install and remove after testing at no additional cost, a temporary glue cap/plug to be airtight for all cleanout stacks to accomplish air testing. The air pressure shall never exceed 8 psi. All gauges shall be accessible outside of the manholes.

HYDROSTATIC TESTS

After the ductile iron sewer pipe has been laid within the "protected" area and backfilled to finished grade, the pipe shall be subjected to a hydrostatic pressure test. All laterals within the "protected" area shall be ductile iron. All sewers subject to hydrostatic testing shall include (1) sewers entering or crossing streams, (2) sewers located less than 100 feet from any public or private water supply source including any WS-I waters or Class I or Class II impounded reservoirs, (3) where the minimum 18 inch vertical and 10 feet horizontal separation cannot be maintained between sewers and water mains (see NC DENR Regulations), or (4) as specified and/or indicated on the drawings. The Contractor will furnish all labor and material, including test pumps, plugs, and all other incidentals for making hydrostatic tests. Hydrostatic pressure testing shall be conducted on the completed main, including the laterals.

The duration of the pressure test shall be at least one hour or longer, as directed by the Public Works Commission. The hydrostatic pressure shall be 150 psi. Each section of pipe shall be slowly filled with water and the specified test pressure based on the elevation of the lowest point of the line or section under test and corrected to the elevation of the test gauge, shall be applied by means of a pump connected to the pipe in a manner satisfactory to the Public Works Commission. Before applying the specified test pressure, all air shall be expelled from the pipe.

All joints showing visible leaks shall be made tight. Cracked or defective pipe, joints, laterals, and fittings discovered in consequence of the pressure test shall be removed and replaced with sound material, and the test shall be repeated until the test results are satisfactory. The requirement for the joints to remain exposed for the hydrostatic test may be waived by the Public Works Commission in certain situations. The test shall be repeated until satisfactory to the Public Works Commission.

The results of the pressure tests shall be satisfactory as specified. All replacement, repair, or retesting shall be accomplished by the Contractor. All repairs shall be reviewed and approved by the Public Works Commission prior to backfill. The use of couplings, sleeves, etc. shall be reviewed and approved by the Public Works Commission prior to use.

END OF SECTION

**DIVISION 2
SITE WORK
02732 - SEWAGE FORCE MAINS**

GENERAL

Sewage force mains and all appurtenant items shall be constructed of materials as specified or indicated on the drawings. The intent and purpose of these specifications is to require a complete and satisfactory installation in every respect and any defect in material or workmanship shall be cause for replacement and correction of such defect as directed by the Public Works Commission and at no expense to the Public Works Commission. All materials and workmanship shall be in complete accordance with the standards and specifications of the Public Works Commission and subject to Public Works Commission inspection and approval.

MATERIALS

PVC PIPE

In order to prevent the sanitary sewer force main from being mistaken for a water main, **all force main PVC pipe shall be green in color.**

Two (2) inch PVC pipe shall be manufactured using Grade 1 PVC compound material as defined in ASTM D-1784 and shall be SDR21, pressure class 200 in accordance with ASTM D 2241 or SDR-17 with a pressure rating of 250 psi, in accordance with ASTM D-2241. Fittings for two (2) inch PVC shall be solvent welded Schedule 80 PVC. The pipe shall be plainly marked with the manufacturer's name, size, material (PVC) type and grade or compound, NSF seal, pressure rating and reference to appropriate product standards.

- A.
- B. All PVC pipe four (4) inches through 12 inches and couplings shall be manufactured using virgin compounds as defined in ASTM D-1784, with a 4000 psi HDB rating and designated as PVC 1120 to be in strict accordance with AWWA C-900. The pipe shall be Class 150 and conform to the thickness requirements of DR18. The pipe and fittings shall be manufactured to withstand 755 psi quick burst pressure tested in accordance with ASTM D-1599 and withstand 500 psi for a minimum of 1,000 hours tested in accordance with ASTM D-1598. Couplings shall be compression, twin gasket type in accordance with ASTM D-3139 for push-on joints and ASTM F-477 for elastomeric seals (gaskets). PVC fittings are not acceptable for mains other than two (2) inch. The pipe joints shall be of the integral bell type with rubber gaskets shall conform to the requirements of ASTM D-

3139 or ASTM F-477. Fittings and specials for mains four (4) inches and larger shall be ductile iron, bell end in accordance with AWWA C-110, 200-psi pressure rating unless otherwise shown or specified, except that profile of bell may have specials of the same material as the pipe with elastomeric-gaskets, all in conformance with the requirements of AWWA C-900. Ductile iron fittings to PVC pipe shall be adequately supported on a firm trench foundation. Fittings shall be for bell and spigot pipe or plain end pipe, or as applicable.

Mechanical restraining systems shall not be used on PVC pipe.

DUCTILE IRON PIPE

The raw material from all ductile iron pipe and fittings shall have an average minimum content consisting of 90% recycled iron and steel. Ductile iron pipe and fittings shall be manufactured in the United States of America in accordance with ANSI/AWWA A21.51/C151. The manufacturer of the ductile iron pipe shall be a member of the Ductile Iron Pipe Research Association (DIPRA).

All ductile iron pipe and fittings (six (6) inches and above) shall be in strict accordance with ANSI/AWWA C-150/A21.50 and ANSI/AWWA C-151/A21.51, Class 50 in every respect. Four (4) inch ductile iron pipe shall be Class 51. Joints shall be mechanical joint or push on joint as specified and installed in accordance with AWWA C-600 and shall conform to AWWA Standard C-111. Mechanical joints shall be of the stuffing box type and shall conform to ANSI A21.11 for four (4) inch pipe through 12-inch pipe. Push on joints, rubber gaskets and lubricant shall conform to ANSI A21.11. Fittings and specials shall be ductile iron and shall be manufactured in accordance with AWWA Standard C-110 (ANSI A21.11).

Compact fittings shall be mechanically restrained, ductile iron in accordance with ANSI A 21.53 (AWWA C-153) for four (4) inch through 12-inch sizes only. Where thrust blocking is utilized, fittings shall be full body ductile iron in accordance with ANSI A 21.53 (AWWA C110). Pressure rating shall be not less than 200 psi unless otherwise specified. All ductile iron interior surfaces shall be lined with two (2) coats of ceramic epoxy to produce a total minimum dry film thickness of 40 mils (Protecto401 or approved equal). The exterior pipe surfaces shall be protected with asphaltic coating as specified in AWWA C151 and C110. Specifications for the ceramic epoxy can be found in Specification Section 09802.

All pipe joints within an encasement shall be furnished with manufactured restrained joints, and as specified in the standard Public Works Commission detail for encasements.

For aerial crossings which are four (4) inches through 12 inches in diameter, manufactured restrained joint ductile iron pipe Class 53, or Class 53 flanged ductile iron pipe shall be utilized in accordance with the standard Public Works Commission detail for aerial crossings. Mega-lugs, field-lok, and gripper rings are not an allowable means of restraint for aerial crossings. For aerial crossings larger than 12 inches, or as noted specifically on the plans, flange joint ductile iron pipe, Class 53, shall be utilized in accordance with the standard Public Works Commission details. The location of flanges shall be specifically designed for each application. The flange pipe shall be in accordance with ANSI/AWWA C-115/A21.15. Threads for threaded flange pipe shall be in accordance with ANSI B2.1, shop fabricated as outlined by AWWA 115 with serrated faces furnished on the pipe, completely factory installed. Welding of flanges to the body of the pipe will not be acceptable. Ductile iron fittings and flanges shall be in accordance with ANSI/AWWA C-

110/A21.10 with a minimum working pressure of 250 psi. Gaskets shall be full faced SBR rubber per ANSI/AWWA C-111/A21.11 with a minimum 1/8" thickness. Linings and coatings shall be as outlined for ductile iron pipe.

If the Public Works Commission determines that an expansion coupling is required, it shall be installed as indicated on the drawings. The expansion coupling shall not be buried.

For subsurface water crossings (i.e., streams, wetlands), restrained joint ductile iron pipe shall be utilized. No mechanical restraint systems (e.g., mega-lugs, field-lok gaskets, etc.) shall be utilized. The pipe shall be installed in a casing, in accordance with the approved Public Works Commission detail, unless otherwise specifically approved by the Public Works Commission.

Transition between ductile iron pipe and HDPE shall be accomplished utilizing mechanical restraints as approved by PWC.

HDPE PIPE

All high density polyethylene (HDPE) pipe and fittings shall be in accordance with PWC Standard Specification Section 02736, most recent edition.

COMBINATION AIR RELIEF AND VACUUM VALVE ASSEMBLIES

All sewer force mains shall have automatic air release valves installed as indicated on the plans, and in accordance with Public Works Commission requirements. The automatic air release valve shall be a combination air release valve. Combination air release valves shall be heavy duty "universal" style, single body units, incorporating the functions of an air and vacuum valve within a single housing.

The tap size shall be a minimum of two (2) inches, however if a larger tap is needed it shall be sized accordingly. The valve body, cover flange, and all internal parts shall be 316 stainless steel. The air release orifice shall be as specified by the Design Engineer. The air release valve shall have a maximum working pressure of 200 psi.

All air and vacuum combination release valves shall be Crispin Model UX20, ARI D-020, H-Tec Model 986, or approved equal. All air release valves shall be installed in accordance with the manufacturer's recommendations.

Air relief and vacuum valve manholes shall be 60 inch diameter precast concrete units conforming to ASTM C-478. The combination air relief vacuum valve manhole shall be cast with an anti-microbial admixture, in accordance with manufacturer's instructions. The manholes and valves shall be installed in accordance with the standard PWC detail. The force main shall consist of one full joint of PVC C-900 (DR18) pipe centered at the air relief valve and a minimum of four (4) feet deep.

Combination air relief and vacuum valves shall be installed using stainless steel double strap service saddles, a two (2) inch ball valve, and a two (2) inch x one (1) inch brass tee with a quick connect attachment as shown in the PWC standard detail.

- C. Service saddles for two (2) inch taps on four (4) inch and larger size iron pipe shall be ductile iron with stainless steel double straps, bolts, nuts and washers
- D. Ball valves shall be all bronze construction, with a handle operator. Ball valves shall be manufactured and tested in accordance with AWWA/ANSI C800. The valve shall be equipped with packing nut, gland, and packing material. Ball valves shall be of an approved type made from approved materials conforming to ASTM specifications and shall also meet the approval of PWC. The turn required to travel from fully closed to fully open on a ball valve shall be 90 degrees.

AIR RELEASE VALVE MANHOLE RING AND COVER

Cast iron manhole frames and covers shall conform to the drawings in all essentials of design with vent holes. The frames and covers shall have a combined weight of not less than 310 pounds and shall conform to ASTM A-48, Class 30 frame and Class 35 cover. Lettering on the cover shall conform to the City of Fayetteville Public Works Commission standards and shall be stamped or cast into all covers so as to be plainly visible. Unless otherwise shown on the drawings, the frames and covers shall be so set that the top of the cover will be flush with finished grade or as directed by PWC.

BY-PASS PUMPING ASSEMBLIES

By-pass pumping assemblies shall be installed in accordance with PWC standard detail S.21. The bypass pumping assembly shall be constructed of ductile iron pipe which meets the requirements of this specification.

INSTALLATION

Pipe installation shall be in strict accordance with Specification Section 02222 – Excavation and Backfilling for Utilities Systems, and as outlined herein.

PIPE LAYING

Pipe installation shall be in accordance with the manufacturer's instructions. Proper equipment shall be utilized to perform the work in a manner satisfactory to PWC. All pipes and fittings shall be carefully lowered into the trench in such a manner to prevent damage to the protective coatings and linings. Under no circumstances shall pipe materials be dropped or dumped into the trench. Pipe shall be carried into position and not dragged.

All dust, dirt, oil, tar (other than standard coating), or other foreign matter shall be cleaned from the jointing surfaces, and the gasket, bell, and spigot shall be lubricated with lubricant recommended by the manufacturer.

Mechanical equipment should not be used to assemble the pipe. Pipe shall be assembled in accordance with the pipe manufacturer's instructions. Any damage resulting from the use of mechanical equipment shall be replaced as directed by PWC.

Adjustments in grade by exerting force on the barrel of the pipe with excavating equipment shall not be allowed. The Contractor shall verify line and grade after assembling each joint.

At any time when pipe laying is not in progress, the open ends of the pipe shall be closed by a water tight plug or other means approved by the PWC Project Coordinator. If water is in the trench, the plug shall remain in place until the trench is pumped completely dry. No pipe shall be laid in water or where in the PWC Project Engineer's and/or PWC Project Coordinator's opinion trench conditions are unsuitable. Every precaution shall be taken to prevent material from entering the pipe while it is being installed.

ALIGNMENT AND GRADE

All pipe shall be installed to the required lines and grades. Structures shall be installed at the required locations. The lines and grades of the pipe will generally be indicated by stakes parallel to the line of the pipe. The Contractor shall be responsible for installing the pipe to proper line and grade.

Threaded PVC and cemented joints will not be permitted. The ends of push on joints shall be beveled to facilitate assembly. Pipe shall be marked to indicate when the pipe is fully seated and the gasket lubricated to prevent displacement. Care shall be exercised to insure that the gasket remains in proper position in the bell or coupling while marking the joint.

All pipe installations shall be properly restrained, utilizing either thrust blocks or approved restraint systems. The thrust blocking shall be in accordance with PWC standards, and as designed by the Engineer. The approved restraint system shall be installed in accordance with the manufacturer's instructions. For the purpose of identification of buried pipes during future trenching or location, a continuous "detectable" identification wire shall be installed as well as green, "Sanitary Sewer Force Main" marking tape. The wire shall be a minimum 12 gauge single strand, coated copper wire or copper clad steel wire that is suitable for underground use. The wire shall be buried continuously along the pipe. The wire shall be "stubbed" into marker posts and air release valve manholes and secured such that a "direct"/conductive metal detector may be used to trace the pipe location.

The marker posts shall be Rhino TriView TracerPeds which are green with a "Sewer Force Main" warning decal (GD-5314K) and have internal terminals. The marker posts shall utilize the TriGrip Anchor system for direct bury installations. The identification wire shall be attached to the marker posts in accordance with PWC standards. Tracing wire marker posts shall be located no more than 500 feet apart.

When the force main is located in unpaved areas such as easements the marker posts shall be installed along the centerline of the force main. When the force main is located in paved areas the marker posts may be offset from the centerline of the force main in a uniform manner. The wire shall be installed with all non-metallic pipelines.

The "Sanitary Sewer Force Main" marking tape shall be green and labeled to warn of the presence of the sewer main. The tape shall be manufactured for durability and resistance to the elements. The marking tape shall be installed with both PVC and ductile iron force mains.

CONNECTION TO EXISTING MANHOLES

Where new mains are to be connected to existing active sanitary sewers, the active sewers shall remain in service by the Contractor. Unless otherwise indicated, where new lines are connected into existing manholes, all or such portion of the manhole invert as is necessary in the opinion of the PWC Project Coordinator shall be removed and a new invert shall be constructed to accommodate both new and existing effluent pipes and flows. Where force mains enter manholes, pipe and fittings shall be restrained as indicated on the plans with the force main outlet directed toward invert out.

All work shall conform to the applicable requirements specified for new manholes including all necessary concrete works, brick work, cutting, shaping and pipe fitting. Existing manhole walls, inverts, and shelves shall be coated with cement mixed with an anti-microbial additive in accordance with Specification Section 09801. New manholes that contain a force main discharge shall be cast with an anti-microbial admixture, in accordance with Specification Section 09801. The Contractor shall coordinate and cooperate with the Public Works Commission Project Coordinator on all connections. Connections to any manhole shall be made using the core and boot method. If necessary, drop or slide structures shall be installed, in accordance with PWC standards.

HYDROSTATIC TESTS

After the pipe has been laid, the valves installed, the taps made and the system has been partially backfilled as specified, all newly laid pipe shall be subjected to a hydrostatic pressure test. Where any section of a force main is provided with concrete thrust blocking for fittings, the hydrostatic test shall not be made until at least five (5) days after installation of the blocking unless otherwise approved. The Contractor will furnish all labor and material, including test pumps, taps, and corporations, for making hydrostatic tests. Cost for said tests shall be included in the Proposal. A PWC Project Coordinator shall be present for all testing. The Contractor shall coordinate with the PWC Project Coordinator for disposing of the test water from the system.

The duration of the pressure test shall be at least one hour or longer, as directed by the PWC Project Coordinator. The hydrostatic pressure shall be 200 psi. The pipe shall be slowly filled with water and the specified test pressure based on the elevation of the lowest point of the line or section under test and corrected to the elevation of the test gauge, shall be applied by means of a pump connected to the pipe in a manner satisfactory to the PWC Project Coordinator. Before applying the specified test pressure, all air shall be expelled from the pipe. If blow offs are not available at the high places, taps shall be made to provide blow offs.

The results of the pressure test shall be satisfactory as specified. All replacement, repair or retesting shall be accomplished by the Contractor at no additional cost to PWC. All materials and methods used to make repairs shall be approved by PWC. The PWC Project Coordinator shall be present while all repair work is taking place.

END OF SECTION

**DIVISION 2
SITE WORK
02737 - DUCTILE IRON PIPE FOR HORIZONTAL DIRECTIONAL DRILLING**

GENERAL

The purpose of this specification is to outline the requirements to furnish, install, and test ductile iron pipe utilized solely for installation of potable water mains by horizontal directional drilling applications. The Contractor shall furnish all labor, materials, equipment, and incidentals necessary to install the ductile iron pipe in accordance with the Contract Drawings and as specified herein.

RELATED SECTIONS

- F. Section 02302 – Horizontal Directional Drilling
- G. Section 02660 – Water Distribution

REFERENCES

The following standards are incorporated by reference into this specification. The latest edition of the reference shall be used.

- A. ANSI/AWWA C150 American National Standard for the Thickness Design of Ductile Iron Pipe
- B. ANSI/AWWA C5151 American National Standard for Ductile Iron Pipe, Centrifugally Cast, for Water
- C. ANSI/AWWA C11 American National Standard for Rubber-Gasket Joints for Ductile Iron Pressure Pipe and Fittings
- D. ANSI/AWWA C104 American National Standard for Cement Mortar Lining for Ductile Iron Pipe and Fittings for Water
- E. ANSI/AWWA C110 American National Standard for Ductile Iron and Gray Iron Fittings, 3-inch through 48-inch, for Water and Other Liquids
- F. ANSI/AWWA C153 American National Standard for Ductile Iron Compact Fittings
3-inch through 24-inch and 54-inch through 64-inch, for Water Service.

In case of conflicting requirements between this specification and these referenced documents, this specification shall govern.

QUALITY ASSURANCE

The ductile iron pipe shall be furnished by manufacturers who are fully experienced, reputable, and qualified in the manufacture of the ductile iron pipe to be furnished. The pipe shall be designed, constructed, and installed in accordance with the best practices and methods and shall comply with this specification section.

All ductile iron pipe and fittings shall be from a single manufacturer. The supplier shall be responsible for the provisions of all test requirements as specified. In addition, all ductile pipe to be installed may be inspected at the plant for compliance with these specifications by an independent testing laboratory acceptable to the Public Works Commission. The Contractor shall require the manufacturer's cooperation in these inspections. The cost of the plant inspection shall be the responsibility of the Contractor.

Inspection of the pipe may be made by any representative of the Public Works Commission after delivery. The pipe shall be subject to rejection at any time on account of failure to meet any of the requirements specified, even though sample pipes may have been accepted as satisfactory at the place of manufacture. Pipe rejected after delivery shall be identified as such, and shall be immediately removed from the job site.

All ductile iron pipe shall be manufactured in accordance with ASTM A 746. Dimensions and tolerances for pipe outside diameter and minimum wall thickness shall be in accordance with ASTM A 746.

Tests for compliance with this specification shall be in accordance with the applicable AWWA, ANSI, and/or ASTM specifications.

DELIVERY, STORAGE AND HANDLING

Care shall be taken in shipping, handling, and storage to avoid damaging the ductile iron pipe. Any pipe damaged in shipment shall be replaced as directed by the Public Works Commission.

Any pipe or fitting showing a crack, or which has received a blow that may have caused damage, even though the damage may not be visible, shall be identified as rejected and immediately removed from the job site.

Ropes, fabric or rubber protected slings and straps shall be used when handling ductile iron pipe and fittings. Chains, cables, or hooks inserted into the pipe ends shall not be used. Two slings spread apart shall be used for lifting each length of pipe. Pipe or fittings shall not be dropped onto rocky or unprepared ground.

Any ductile iron pipe that has been damaged or does not meet the Public Works Commission's approval shall be replaced at the Contractor's expense.

MATERIALS

Restrained joint ductile iron (RJDI) pipe shall be used for water main installation by horizontal directional drilling. All RJDI shall be in accordance with Specification Section 02660 – Water Distribution and as outlined herein. Where discrepancies between the specifications exist, the more stringent shall apply.

All RJDI pipe utilized for pipe bursting shall be factory restrained, with the restraint internal to be pipe (i.e., "boltless"). The use of mechanical restraints (i.e., mega-lugs, grip-rings, etc.) is not allowed. All restrained joint ductile iron pipe shall be as manufactured by U.S. Pipe's TR-Flex,

Griffin Pipe Products SNAP-LOK, American Cast Iron Pipe Company's Flex-Ring Joint, or approved equal.

Ductile iron pipe used for horizontal directional drilling shall meet all requirements of ANSI/AWWA C151/A21.51, Class 50 (unless otherwise specified). Unless otherwise specified, the pipe shall be lined with cement mortar, in accordance with ANSI/AWWA C104/A21.4, with all operations completed in a single facility by one manufacturer.

Joints used for directional drilling shall be boltless, flexible restrained, with smooth contoured bells. Joints with bulky glands or flanges that may prevent the smooth flow of the drilling fluid/slurry over the joint are not acceptable.

The flexible restrained joint shall be capable of withstanding the maximum pulling loads expected for this project.

Compliance with the above requirements must be certified by the pipe supplier.

INSTALLATION

The Contractor shall take all necessary measures to ensure the ductile iron pipe is not damaged or scarred in any way during delivery, storage, or installation. Any damage to the ductile iron pipe will result in the pipe or section of the pipe, being rejected and replaced with undamaged ductile iron pipe at no additional cost to the Public Works Commission.

The entry angle of the drill string shall range from 8 degrees to 20 degrees. Exit angles for the drill string shall take into consideration the allowable deflection and the method of installation proposed for the new flexible restrained joint ductile iron pipe. The Contractor shall submit a detailed plan showing the connection between the HDD installed piping and the next section of pipeline

The Contractor shall maintain the borepath alignment and radii that are indicated on the project drawings. Any alternate designs must be submitted to the PWC Project Engineer for approval prior to commencement of drilling operations, and shall be based on a range from 50-feet to 100-feet per inch of nominal diameter, using 20-foot joint lengths. The maximum deflection of the pipe shall not exceed the manufacturer's recommendations.

The finished inside diameter of the borepath shall be nominally 1.5 times the outside diameter of the ductile iron pipe bell for pipe sizes 4-inch through 24-inch. The inside diameter of the borepath for pipe sizes 30-inch through 48-inch shall be equal to the outside diameter of the ductile iron pipe bell plus 12-inches.

The Contractor has the option of joining the pipe utilizing one of the two methods described below:

- Cartridge Assembly. Cartridge assembly option shall be defined by the assembling of individual sections of the flexible restrained joint ductile iron pipe in a secured entry and assembly pit. The pipe sections are assembled individually and then progressively pulled into the borepath a distance equivalent to a single pipe section. This assembly-pull process is repeated for each pipe length until the entire line is pulled through the borepath to the exit point. At all times prior to the pipe entering the bore path the Contractor shall

- monitor the pipe to assure that the allowable joint deflection is not exceeded.
- **Assembled-Line.** Assembled-line option shall be defined by the pre-assembly of multiple pieces of the flexible restrained joint ductile iron pipe, with subsequent pulling installation into the borepath as one continuous pipe string. With this option the Contractor shall provide an entry ramp to the entrance of the borepath. The ramp should be of sufficient length and grade such that no pipe joint exceeds the allowable joint deflection as specified by the manufacturer, at any point prior to the pipe string entering the properly designed and prepared borepath. The Contractor shall be responsible for providing the necessary equipment or ground surface preparation to allow the pipe to be pulled back along the surface prior to the entry ramp and borepath. At all times prior to the pipe entering the bore path the Contractor shall monitor the pipe to assure that the allowable joint deflection is not exceeded.

The Contractor shall be responsible for the proper assembly of all pipe and appurtenances in accordance with the manufacturer's written procedure and as supplemented by these specifications. Prior to assembly, all joints and joint components shall be thoroughly cleaned and examined to assure proper assembly and performance. In the event that the Contractor is not experienced with the assembly of the type of flexible restrained joint being used, it shall be the responsibility of the Contractor to contact a factory-trained representative for recommendations on the proper and efficient installation of the joint.

TESTING

Testing of the installed ductile iron pipe shall be done in accordance with the requirements outlined in Section 02660 – Water Distribution. All testing shall be satisfactorily completed prior to placing the system into service. The Contractor shall fully cooperate with the PWC Project Coordinator to schedule and complete all testing.

END OF SECTION

**DIVISION 2
SITE WORK
02831 - CHAIN LINK FENCING**

GENERAL

Where shown on the plans there shall be installed a "chain link" fence with all necessary posts, braces, top rail, gates, fabric, extension arms, and three strand barbed wire.

The erected fence shall meet the following requirements:

The enclosing fence shall have an overall fabric height of six feet (6') and an additional one foot (1') of three strand barbed wire, for a total height of seven (7'). The gates shall be seven feet (7') in overall height.

MATERIALS

Fabric: Fencing shall be chain link #9 gauge aluminized continuously woven wire 2" uniform square mesh without knots or ties, except for knuckling and barbing. Both the top and bottom edges of the fabric shall be barbed unless otherwise shown on the plans. The Contractor shall not piece together a number of short pieces of fence fabric.

Tensile Strength Test: Wire pickets of which this fabric is made to stand a tensile strength test of approximately 70,000 pounds per square inch based on the cross sectional area of the galvanized wire.

Framework: All posts and other appurtenances used in construction shall be hot-dipped, galvanized with a minimum of 1.8 oz. per square foot surface.

Line Posts: Hot dip galvanized "H" column (2" x 2 1/4") weight 4.1 pounds per linear foot, minimum carbon content 0.355. No used or open seam material will be permitted in posts or rails. (Alternate 2 1/2" O.D. galvanized pipe weight 3.65 pounds per linear foot or C-section line posts of the same dimension as H-post, 0.120 in wall thickness and fabricated from steel conforming to ASTM A-570, Grade E.) Intermediate posts shall be evenly spaced no more than 10 feet apart on center.

Top Rail: Hot dip galvanized pipe 1 5/8" O.D., weight 2.27 pounds per linear foot protected with outside sleeve type couplings at least 7 inches long. No used or open seam material will be permitted.

Terminal Posts: End, corner and pull posts hot dip galvanized pipe 3" O.D. - 5.79 pounds per linear foot. Gate posts hot dip galvanized pipe of "H" construction as specified.

Tension Wire: A bottom tension wire 7 gauge, alzd. (0.4 oz./s.f.), 6 inches above grade. Wire shall be fastened to fabric with aluminum rings at 24" on center and to each intermediate post.

Extension Arms: Hot dip galvanized. Line post arms of pressed steel malleable base; end, and corner post arms of malleable iron; gate posts to have ornamental top. Each extension arm to carry three strands of barbed wire approximately 12 inches out from fence line. Barbed wires to be securely fastened in by means of self-locking grooves. The barbed wire shall support a

minimum of 400 lbs. vertical dead load from tip of arm. The barbed wire shall be 4-point pattern composed of two strands of No. 12 1/2 gauge galvanized wire.

Gates: Frame to be galvanized pipe 2.0 inches O.D. weighing 2.27 pounds per foot. Each frame to be equipped with 3/8-inch diameter adjustable truss rods. Gateposts and corner posts shall be 3 inches O.D. weighing 5.11 pounds per foot. Gates are to be manufactured using 2" aluminum tubing in lieu of the specified Schedule 40 steel pipe. Gateposts and corner posts shall be 6 5/8" O.D. for swing gates (greater than 20 feet in length and 4" O.D. for slide gates, weighing minimum of 5.11 pounds per foot. Corner fittings to be heavy pressed steel or malleable castings. Fabric to be same as in fence. Gates to be completed with malleable ball and socket hinges, catch, stops and rest. Hinges to permit gate to swing back against fence, 180 degrees if required. Latches shall be arranged for padlocking so that the padlock will be accessible from both sides of the gate regardless of the latching arrangement.

Braces: Brace material to be hot dip galvanized and same as top rail, to be spaced midway between top rail and ground, and to extend from terminal post to first adjacent line post. Braces to be securely fastened to post by suitable connections, and then trussed from line post back to terminal post with 3/8 inch round rod equipped with a turnbuckle for adjusting.

Fittings: Hot dip galvanized. All fittings to be malleable, cast iron or pressed steel.

Fabric-Bands: Fabric to be fastened to line post with (9 gauge) fabric bands spaced approximately 18 inches apart, and to top rail with wires (9 gauge) spaces approximately 24 inches apart.

Locks: Locks will be provided by the Owner.

INSTALLATION

General: Installation shall be made in a workmanlike manner by skilled workers experienced in the erection of this type of fence and in accordance with the manufacturer's recommendations. The fence shall be erected on a previously prepared surface to the lines and grades indicated on the plans.

Post Setting: All posts shall be set plumb and in alignment into a 36-inch concrete footing of proper size and shape so as to furnish sufficient support to withstand any strain or shock ordinarily brought to bear on a fence of this character. The concrete strength shall be 3000 psi (ASTM C-94) and the foundations a minimum of 9 inches in diameter for line post and 12 inches for terminal post.

Concrete shall be thoroughly compacted so as to be free of voids and finished in a dome. Straight runs shall not exceed 500 feet between brace posts. Concrete shall cure a minimum of 72 hours before any further work is done on the posts.

Fabric: The fabric and barbed wire shall be stretched to the proper tension as recommended by the manufacturer and securely fastened to the framework members to result in a straight fence line without sagging. The bottom of the fabric shall be held as uniformly as is practicable to the finished grade.

END OF SECTION

**DIVISION 2
SITE WORK
02931 - SOD**

GENERAL

Restoration of existing lawn areas outside of the public right-of-way disturbed by construction activities shall be by installation of new sod. Restoration and sod shall be performed as soon as practical, but the time period between initial disturbance, the utility installation and sod placement shall not exceed 60 days. Sod is defined as blocks, squares, strips of turf grass and adhering soil used for vegetative planting. Sodding and preparation of the sod bed shall be performed by an experienced landscape subcontractor specializing in this type of operation unless otherwise approved by the Public Works Commission in writing.

The Contractor shall adhere to the standards set forth by the American Association of Nurseryman and the Associated Landscape Contractors of America. All personnel shall be appropriately trained with regard to the degree of involvement so to assure the Owner the highest level of workmanship. Sod species suitable in this area are hybrid bermuda, centipede and zoysia; however the sod placed for each individual's lawn shall be the same species of sod as existing. Sodding may be performed at any time of the year except frozen sod shall not be placed nor shall sod be placed on frozen ground. The Contractor shall adapt his operations to variations in weather or soil conditions as necessary for the successful establishment and growth of a vigorous, disease free and weed free sod lawn.

MATERIAL

Materials, equipment and products incorporated in the work shall be approved by the Public Works Commission. The Contractor shall submit a list of the proposed materials with samples, if required. Package materials should be delivered in unopened original containers showing weight, analysis and name of manufacturer. The Contractor shall protect the material from deterioration and/or damage

Sod shall contain 95 percent permanent grass; not more than five (5) percent weeds and undesirable grasses, good texture and free from obnoxious grasses, roots, stones and foreign materials. Sod shall be uniformly 1 ½ to 2 inches thick with a well developed fibrous root mat system in topsoil with clean cut edges. The sod shall be sufficiently dense and cut to the minimum required thickness such that if the sod is suspended by one corner, the sod will not tear apart. The sod shall be recently mowed to a height of not more than three (3) inches prior to harvest. The sod shall be supplied and maintained in a healthy condition as evidence by the grass being a normal green color in appearance, dense, and free from insects, pests, disease or injury. Sod shall be delivered to the job site within 24 hours after being cut and shall be installed within 24 hours after delivery. Any sod which is torn, broken or too dry will be rejected.

SOIL BED PREPARATION

Before landscape construction is to begin, the site shall be cleaned and disposed of brush, rubbish, stones, gravel and other foreign material within the area to be landscaped. Exposed ground surfaces disturbed during construction activities shall be graded to the original contours (allowing for the thickness of the sod) or as in the case of an altered contour such as a fill slope,

graded as directed by the Public Works Commission to finish grade, or typical cross section. The sod bed shall be excavated to such a depth that after sod placement the top of the sod shall be flush with surrounding grade or contours. Rake areas to be sodded smooth, free from unsightly variations, bumps, ridges or depressions. Do not start work until conditions are satisfactory and do not work during inclement or impending inclement weather.

The surface area to receive sod shall contain a minimum of four (4) inches of good, fertile, friable, organic natural topsoil loam as a base for laying the sod. Topsoil shall be free of clumps, brush, sticks, weeds, stones, roots, trash or other objectionable material. Contractor shall insure all topsoil to be free of plants or plant parts of quackgrass, johnson grass, nut sedge, poison ivy or other noxious weeds. The Contractor shall furnish and supplement the existing topsoil at no additional costs to the Public Works Commission providing a minimum four (4) inch thickness as specified. Soil preparation shall not be performed in frozen or extremely wet conditions. The finished topsoil bed shall be uniform in grade, with a yard like appearance. All changes in grade shall have a smooth, rounded peaks and valleys.

The soil shall be scarified or otherwise loosened to a depth of not less than five (5) inches and all clods shall be broken. The top four (4) inches shall be worked into an acceptable smooth, friable and uniformly fine texture sod bed by use of soil pulverizers, drags, harrows or by other methods approved by the Public Works Commission. Commercial grade fertilizer (8% nitrogen, 8% phosphate, 8% potash) shall be applied at a rate of 20 pounds per 100 square feet, super-phosphate at 12 pounds per 1,000 square feet and lime (dolomite limestone containing not less than 85% total carbamates) shall be applied at a rate of 25 pounds per 1,000 square feet or at a rate recommended for the type of sod being placed. Apply soil amendments within 24 hours after raking topsoil base surface and not more than 48 hours prior to laying sod. Mix thoroughly a minimum depth into the upper four (4) inches of topsoil and lightly water to aid in dissipation. Sod placement shall not begin until the soil preparation is inspected and approved by the Public Works Commission. During application of soil amendment fertilizer etc., adequate precautions shall be taken to prevent damage to existing features such as traffic, structures, landscape, trees, vegetation, utilities or any other appurtenances. The Contractor shall be required to repair or clean any damages.

PLACING SOD

The Contractor and his landscape subcontractor shall coordinate the placing of the sod to begin within 24 hours after the topsoil base preparation is completed and accepted by the Public Works Commission. Sod shall be brought to the site as near to the time of placing as possible. Store sod in the shade, and keep watered particularly in extreme hot and dry condition to insure vitality and to prevent the dropping off of soil during handling. During wet weather, the sod shall be allowed to dry sufficiently to prevent tearing. Handling shall be done in a manner which will prevent tearing, breaking, drying or other damage. Carefully place sod in rows with the longer side perpendicular to slopes and the ends staggered in each successive row in a brick-like pattern. Butt the ends and sides together tightly and do not overlap or stretch the sod. Do not leave any voids or gaps. Unavoidable gaps shall be closed with small pieces of torn or broken sod if kept moist and approved by the Public Works Commission. After the sod is laid, irrigate thoroughly to allow water to penetrate a minimum six (6) inches into the soil below the sod. Sod shall not be placed when the atmospheric temperature is below 32oF.

Tamp and roll completed sod installation with a manual roller or approved equipment to eliminate

minor irregularities and to form close contact with the soil bed immediately after placing and watering. The type of rolling and tamping equipment to be used shall be submitted to the Public Works Commission for approval prior to construction. On steep slopes 3:1 (horizontal and vertical) or greater, in drainage ditches or any areas where sod slipping may occur, anchor sod with approved wooden stakes ($\frac{1}{2}$ "x $\frac{3}{4}$ " x 12") or staples spaced not over two (2) feet apart in any direction and/or in sufficient number to prevent slippage or displacement. The anchors shall be driven flush with the surface of the sod. The wide flat side of the stake shall be driven parallel to the slope. Staking shall be done concurrently with sod placement and prior to tamping. Sod shall be laid with the long horizontal edge of the strips parallel to the contour starting at the bottom of the slope. The edge of the sod shall be turned slightly in the ground at the top of a slope and a layer of earth placed over it and compacted so as to conduct the surface water over and onto the top of the sod. Upon completion of the above described work, the surface of the sodded areas shall coincide with the finished grade and not exceed $\frac{1}{4}$ " plus or minus variation to adjoining grade or proposed contour. Extreme care shall be taken to prevent the installed sod from being torn or displaced.

MAINTENANCE

The Contractor shall, at no additional cost to the Public Works Commission, make whatever arrangements necessary to supply water of suitable quality and purity to sustain and encourage vigorous plant growth, and supply all equipment for proper delivery and application to planted areas. Water obtained from a PWC fire hydrant shall be metered and properly protected with an approved backflow prevention device. PWC must inspect and approved any connections to their water system to include the proposed water application and storage equipment. The Contractor shall not use private resident's water. The Contractor is solely responsible to provide watering of the sod. The method of application of water shall be approved by the Public Works Commission. Limit watering to early morning or late afternoon to enable to soil the absorb maximum amount of water.

Maintenance shall begin immediately after sodding operation. The Contractor shall maintain all sodded areas until sod is firmly established and as outlined below. Maintenance will include watering, fertilizer, pest control, soil amendments, disease control, erosion repair, mowing, protecting turf area from traffic (i.e. temporary fences, barriers, signs, etc.) and replacement of any dead or damaged sod.

Watering

- Water lawn areas once a day with a minimum $\frac{1}{2}$ inch water for the first three (3) weeks after area sodded.
- After the three (3) week period, water twice a week with a $\frac{3}{4}$ inch of water each time unless a comparable amount of rainfall has occurred.
- Make weekly inspections to determine moisture content of soil and supplement the above watering schedule as needed.
- Excessive runoff puddling and wilting shall be prevented.

Fertilizer and Pest Control

- Evenly spread fertilizer composite at a rate of 40 pounds per 5,000 square feet or as recommended by the manufacturer. Fertilizer shall not be applied until two (2) weeks after initial placement of the sod or prior to the advent of winter dormancy.

- Treat areas of weed and insect infestation as recommended by the treatment manufacturer.

Mowing

- The Contractor shall do mowing operations, (in yards not being mowed by residents) until provisional acceptance.
- Mowing shall be done only when the grass is dry with a rotary type mower having a blade height set not lower than one and one half (1½) inches nor higher than three (3) inches.
- Mowing operations shall be conducted at intervals, which ensure grass height does not exceed four (4) inches between mowing.
- The Contractor shall complete at least one mowing operation before the work will be considered for acceptance.

The Contractor shall protect and not allow access of vehicular traffic into any newly sodded areas and shall repair any damaged turf to original grade. Maintenance shall continue for a period of 90 days after placement or until provisional acceptance by the Public Works Commission. A written record shall be furnished to the Owner of the maintenance work performed. At least two weeks shall elapse after chemical control is applied before a request of inspection.

ACCEPTANCE

Fifteen (15) days prior to the end of the 90 day maintenance period, the Contractor shall make a written request to the Public Works Commission for an inspection and provisional acceptance of the sod. Failure to notify the Public Works Commission will not relieve the Contractor of the maintenance provisions required and the Contractor will continue to be responsible for the maintenance of the sod.

Replacement of dead sod shall be performed within seven (7) days after notification by the Public Works Commission and the maintenance period for these areas or individual lawns shall be extended for the 90 day maintenance period. Failure to replace dead sod within the specified seven (7) day period will result in the Public Works Commission having the work performed and deducting the cost from the Contract; however, the Contractor shall be responsible for the maintenance.

Final acceptance will be given upon satisfactory contract performance exhibited at final inspection and acceptance. Sodded areas are to be fully rooted prior to acceptance. The Owner shall be the sole judge as to whether or not the lawns are acceptable. Should any deficiencies be disclosed at final inspection, the Contractor shall make the necessary corrections in a timely manner and request re-inspection.

GUARANTEE

The Contractor shall guarantee a dense, vigorous stand of turf free of weeds, disease, pests or any dead areas more than one half of a square foot in size for a period of 90 days from initial placement or replacement whichever is greater. Total dead area shall not exceed one percent (1%) of total square footage for each individual resident's lawn.

END OF SECTION

**DIVISION 2
SITE WORK
02933 - LAWNS AND GRASSES (SEEDING)**

GENERAL

All exposed ground surfaces that have been disturbed during construction shall be graded to original contours as practicable, shaped to drain, and free of trash and debris. Grassing shall be accomplished as soon as practicable after sections of work are completed. Seeding and/or planting shall be performed by an experienced subcontractor specializing in this type of operation, unless otherwise approved by the Public Works Commission in writing. Disturbed sections shall not exceed one mile, without prior approval by the Public Works Commission. Grassing shall be in accordance with the Contract Documents.

PREPARATION OF THE SOIL

The surface area to receive seed shall contain a minimum of four (4) inches of good, fertile, friable, organic natural topsoil loam as a base for spreading the seed. Topsoil shall be free of clumps, brush, sticks, weeds, stones, roots, trash or other objectionable material. Contractor shall insure all topsoil to be free of plants or plant parts of quackgrass, johnson grass, nut sedge, poison ivy or other noxious weeds. The Contractor shall furnish and supplement the existing topsoil at no additional costs to the Public Works Commission providing a minimum 4 inch thickness as specified. Soil preparation shall not be performed in frozen or extremely wet conditions. The finished topsoil bed shall be uniform in grade, with a yard like appearance. All changes in grade shall have a smooth, rounded peaks and valleys.

The topsoil shall be loosened and mixed to the depth of four inches (4"). Suitable equipment (cultipackers, harrows, drags) meeting the approval of the Public Works Commission shall be used. This operation shall be accomplished by cutting on one (1) foot centers parallel to the contour of the slopes. On slopes that are steeper than 2:1, both depth preparation and degree of smoothness may be reduced, if approved by the Public Works Commission, but in all cases the slope surface shall be scarified groove, trenched or punctured so as to provide a textural plane of cut forming pockets, ridges, or trenches in which seeding material can lodge. Soil preparation shall not be performed when the soil is frozen, extremely wet or in an otherwise unfavorable working condition. The soil shall be free of any substance that might inhibit plant growth. Assistance of the local agricultural agent is recommended.

Lime shall be applied at the rate of 1/2 tons per acre. 10-20-20 commercial fertilizer shall be applied at the rate of 1,000 pounds per acre and well worked in to the top four inches (4") of top soil. If hydroseeding, use 500 pounds of 10-10-10 fertilizer on slopes steeper than 1/2 horizontal to 1 vertical.

SEED MIXTURE AND SOWING THE SEED

Seed shall be seed certified to be the latest season's crop and shall be delivered in original sealed packages bearing the producer's guaranteed analysis for percentages of mixtures and pure live seed. The producer's seed label shall indicate it the minimum percent of pure live seed (which shall be 82.45 for Bermuda, 88 for Rye Grain), the minimum percent of germination in hard seed

and maximum percent of weed seed (no more than 1 percent for Bermuda, 0.5 percent for Rye Grain). Seed shall be labeled in conformance with U.S. Department of Agriculture rules and regulations under the Federal Seed Act and applicable State seed laws. Seed that has become wet, moldy, or otherwise damaged will not be acceptable.

The following seed mixture shall be used:

	<u>POUNDS OF SEED PER ACRE</u>			
	K-31 Fescue	Rye	Grain Centipede	Common Bermuda
April 15 - Sept. 1	75	-	60 (hulled)	5
Aug. 15 - Nov. 15	120	-	25 (hulled)	5
Nov. 1 - April 1	120	120	25 (un-hulled)	5

Note: If there are differences in the seed mixture between the mixture stated in these specifications and that which is specified as part of an approved Erosion Control Plan, the seed mixture specified in the erosion control plan shall take precedence.

Where construction crosses a pasture that has been grassed, the Contractor shall re-seed the area with the same type of grass as found on the site. All highway rights-of-way, and private yards disturbed shall also be re-seeded or with the same type of grass previously found. The seed mixture specification shall be used as a guide and the Contractor is charged with the responsibility of seeding areas with the proper type of grass that matches the existing.

Seed shall be broadcast uniformly by hand or by approved sowing equipment. One half of the seed shall be sown in one direction and the remaining shall be sown at right angles to the first. Do not seed when the wind velocity exceeds five (5) miles per hour. Rake lightly into top 1/8 inch of the soil prior to compacting, with a roller not exceeding 100 pounds.

All seeded areas will be mulched with two (2) tons per acre of small grain straw or wood cellulose fiber spread uniformly, approximately 1/4 of ground should be visible to avoid smothering seedlings. Asphalt emulsion (ASTM D-977 and ASTM D-2028) shall be used to anchor the straw applied at 150 gallons per ton of straw, or crimped to stabilize. Asphalt emulsion shall be required from November 1st to March 31st. The Contractor shall take sufficient precautions to prevent mulch from entering drainage structures through displacement by wind, water or other causes and promptly remove any blockage which may occur.

SPECIAL CONSIDERATIONS

Shrubbery shall be expertly removed and carefully preserved for replanting, unless otherwise directed by the Public Works Commission adequate earth ball shall be removed to guard against damage to the root system. Shrubbery shall be replanted only after all construction is complete. The excavation made for replanting shall be six inches (6") larger in every dimension than the root ball removed. This additional space shall be filled with a mixture of one half topsoil and one half peat moss. Care shall be taken to set the top of the ball slightly above or flush with the surrounding

surface. Any shrubbery damaged or that dies shall be replaced with an equal or better plant material at the Contractor's expense.

MAINTENANCE

The Contractor shall protect and maintain grassed areas as necessary to establish a uniform turf composed of the grasses specified. The Contractor shall re-seed any bare areas and repair all eroded areas.

Watering of seeded areas will be required during periods of dry weather to promote maximum growth. The Contractor shall supplement natural rainfall to insure a minimum of one (1) inch of rainfall weekly.

Maintenance of lawns begins immediately after the area is planted and continues for the period required to establish acceptable lawns, but not less than sixty (60) days after initial seeding, or until provisional acceptance by Owner. Maintain seeded areas by watering, fertilizing, mowing, weeding and other operations such as rolling, re-grading, replanting, aerating, and mulching as required to establish an acceptable lawn free of eroded or bare areas.

ACCEPTANCE

Fifteen (15) days prior to the end of the sixty (60) day maintenance period, the Contractor shall make a written request to the Owner for an inspection and provisional acceptance of the seeded area. Failure to notify the Owner will not relieve the Contractor of the maintenance provisions required and the Contractor will continue to be responsible for the maintenance of the seeded area.

Replacement of dead seed area(s) shall be performed within seven (7) days after notification by the Public Works Commission and the maintenance period for these areas or individual lawns shall be extended for an additional sixty (60) day maintenance period. Failure to replace seeded area(s) within the specified seven (7) day period will result in the Owner having the work performed and deducting the cost from the Contract; however, the Contractor shall be responsible for the maintenance.

Final acceptance will be given upon satisfactory contract performance exhibited at final inspection and acceptance. Seeded areas are to be fully rooted prior to acceptance. The Owner shall be the sole judge as to whether or not the lawns are acceptable. Should any deficiencies be disclosed at final inspection, the Contractor shall make the necessary corrections in a timely manner and request re-inspection.

Payment to the Contractor for seeding areas will be approved once the seed has been established and meets the requirements of this paragraph of this specification.

GUARANTEE

The Contractor shall guarantee a stand of turf is considered acceptable when a live vigorous stand of permanent grass is established with growing sprouts visible at the surface showing not less than 9 seedlings of permanent grass at least 2 inches long in each square foot, and where

no gaps larger than 4 inches in diameter occur anywhere in the lawn area. Permanent grass is defined as Common Bermuda, Centipede, and Fescue.

END OF SECTION

**DIVISION 2
SITE WORK
02934 - SEEDING WETLANDS**

GENERAL

All exposed ground surfaces that have been disturbed during construction shall be graded to original contours, reasonably smooth, and free of trash and debris. Grassing shall be accomplished as soon as practicable after sections of work are completed. Seeding shall be performed by an experienced subcontractor specializing in this type of operation, unless otherwise approved by the Engineer in writing. Disturbed sections shall not exceed one half mile, without prior approval by the Engineer. Grassing shall be in accordance with the following specifications:

PREPARATION OF THE SOIL

The topsoil shall be loosened and mixed to the depth of 4" to 8". Suitable equipment meeting the approval of the Engineer shall be used. The soil shall be free of clay lumps, brush, weeds, stones, roots, stumps or any other substance that might inhibit plant growth. Assistance of the local agricultural agent is recommended.

Provide agricultural lime at rate required to bring soil acidity to slightly acid - ph 6, according to soil test report.

Lime and fertilizer shall be applied uniformly and mixed with the soil during seedbed preparation. Apply 10-20-10 commercial fertilizers at the rate of 20-lbs./1000 s.f. for warm season mix and 10-20-10 commercial fertilizer at a rate of 20 lbs./1000 s.f. for cool season mix.

Apply 10-10-10 commercial fertilizers at the rate of 20-lbs./1000 s.f. for temporary cover crops. In addition, provide 15-lbs./1000 s.f. of superphosphate.

The following is for the warm season mix:

- a. All warm grass seed shall be debarbed or conditioned by brushing to create a product nearly the same as debarbing. This does not apply to Switchgrass.
- b. Disk two times to break-up crop residue and dirt clods prior to seeding.
- c. Pack soil to create a firm seedbed with a cultipacker or roller.
- d. If a rain shower should fall after the seedbed is prepared but before planting break-up any crust formation.
- e. Seeding shall be installed to a depth of 1/4" utilizing a rangeland drill or conventional grass drills. It is extremely important that seed not be planted deeper than 1/2" depth. Do not disc or harrow after seeding. This will put the seed too deep. A Brillion seeder will be acceptable.

The following seed mixture shall be used:

Dates	Types	Rate
April 1 - July 15	Warm Season Mix Switchgrass, Cave-in-rock, Alamo Smartweed; and Japanese Millet or Sorghum Sudan Grass Hybrids (Mow prior to maturity)	8 pls #/acre or 4 oz./1000 s.f. 2 bulk #/acre or 1 oz./1000 s.f. 20-lb/acre or ½ lbs/1000 s.f.
July 16 - Sept 1	Temporary crop of Japanese Millet or Sorghum Sudan Grass Hybrids (To be followed by permanent mixture)	20-lb/acre or ½ lbs/1000 s.f.
Sept 2 - Nov 1	Cool Season Mix Reed Canary Grass	12 bulk #/acre or 6 oz./1000 s.f.
	Smartweed	2 bulk #/acre or 1 oz./1000 s.f.
Nov 2 - March 31	Temporary Crop of Wheat (To be followed by permanent mixture)	40 lbs/acre

All highway rights-of-way, and private yards disturbed shall also be re-seeded or sodded with the same type of grass previously found. The seed mixture specification shall be used as a guide and the Contractor is charged with the responsibility of seeding areas with the proper type of grass existing.

Seed shall be broadcast uniformly by hand or by approved sowing equipment. One half of the seed shall be sown in one direction and the remaining shall be sown at right angles to the first. Do not seed when the wind velocity exceeds 5 miles per hour. Rake lightly into top 1/8 inch of the soil prior to compacting, with a roller not exceeding 100 pounds.

All seeded areas will be mulched with 75 pounds to 100-lbs./1000 s.f. of clean wheat straw, spread uniformly, approximately 1/4 of ground should be visible to avoid smothering seedlings. If hydro-seeded, use virgin paper mulch only. The Contractor shall take sufficient precautions to prevent mulch from entering drainage structures through displacement by wind; water or other causes and promptly remove any blockage, which may occur.

MAINTENANCE AND GUARANTEE

The Contractor shall protect and maintain grassed areas as necessary to establish a uniform turf composed of the grasses specified. The Contractor shall re-seed any bare areas and repair all eroded areas.

Maintain seeded areas by watering, fertilizing, mowing, weeding, and other operations such as rolling, regrading, replanting, aerating, mulching as required to establish an acceptable lawn free of eroded or bare areas.

ACCEPTANCE

The Contractor shall guarantee a stand of turf is considered acceptable when a live vigorous stand of permanent grass is established with growing sprouts visible at the surface showing not less than 9 seedlings of permanent grass at least 2 inches long in each square foot, and where no gaps larger than 4 inches in diameter occur anywhere in the seeded area.

END OF SECTION

**DIVISION 2
SITE WORK
03301 - CONCRETE CONSTRUCTION (UTILITY)**

GENERAL

Concrete construction specified in this section shall be applicable to all "site work" and is not intended to cover general building specifications. The concrete work shall include all furnishing, hauling, fine grading and subgrade, form work, etc. and all incidentals necessary for completion of the work as it pertains.

MATERIALS

Concrete

The Contractor shall furnish and place concrete in strict accordance with the requirements of ACI 318 (most recent edition). Ready-mixed concrete from an approved mixing plan shall be used throughout the work and conform to the requirements of ASTM C-94 for batch, mixing, and transporting. Concrete shall be in accordance with the following requirements:

- | | |
|---|------------------------|
| A. Under Ground - Regular Weight Concrete | |
| 28-day compressive strength | 3000 psi |
| Coarse aggregate | 1 ½" max. size stone |
| Slump | 2" minimum, 4" maximum |
| Air Entrainment | No requirement |
| B. Walls, Slabs, Sidewalks, Curb and Gutter - Regular Weight Concrete | |
| 28-day compressive strength | 3000 psi |
| Coarse aggregate | ¾" max. size stone |
| Slump | 2" minimum, 4" maximum |
| Air Entrainment | 5 more or less 1 |

The Contractor shall submit for approval mix designs, designed and tested by an approved testing laboratory, following the requirements of ACI 318 for each class of concrete to be used on this project. Mix designs in excess of one year old shall be verified. The Contractor will be responsible for all costs involved in the mix design. Material suppliers and material proportions incorporated in the mix design and certification shall not change without written permission from the Public Works Commission.

Admixtures used to produce entrained or air shall be sulfonated hydrocarbons or neutralized vinsol resins conforming to ASTM C-260. Calcium chloride, other accelerators, or "anti-freeze" shall not be used without written approval by the Public Works Commission.

Reinforcing Steel

Reinforcing bars shall be new billet stock and shall conform to ASTM A-615, Grade 60. Bars shall be deformed to conform to ASTM A-305. The Contractor shall check and submit for approval four (4) sets of shop and erection drawings prepared by the fabricator. Reinforcement detailing and placement shall conform to ACI 318. All reinforcing bars shall be tied in place according to

approved erection drawings, using bar supports and accessories conforming to ACI 315. Laps or splices shall conform to ACI 318, and consist of the following minimum dimensions:

Tension Splices	36 Bar Diameters
Compression Splices	30 Bar Diameters

All reinforcing bars shall be tagged and stored in such manner as to be readily available at the time needed. Tag mark substitutions will not be made.

Welded wire mesh fabric reinforcing shall conform to the requirements of ASTM A-185. Lap splices shall be at least one full mesh plus 2" staggered to avoid continuous laps in either direction and securely wired or clipped.

GRADING

The Contractor shall use every effort to observe any possible misalignments in line or grade of the installed forms and will call such to the attention of the Public Works Commission promptly. The Contractor is cautioned that he shall be responsible for any damage to utility lines caused by his negligence. The Public Works Commission or his representative shall then inspect the forms and if approved, pouring operations may begin. Where unstable material exists, the Contractor shall remove such material to a depth required to provide a stable subgrade at no additional cost to the Public Works Commission.

FORM WORK

Metal forms shall be used throughout the work except for short, odd length sections and in accordance with ACI 301 and ACI 347 (most recent editions). Earth cuts may be used as forms for unexposed vertical surfaces on footings, provided the soil and workmanship allow an accurate and curable excavation. Forms shall be kept in good condition at all times. Any forms which have become out of shape or otherwise unsuitable shall be removed from the work. Forms shall be of such section and design that they will adequately support the concrete and any construction equipment used in the work. Form sections shall be provided with interlocking joints to ensure that the forms are tightly jointed together free from movement. Forms shall be held in place by metal pins, not less than eighteen (18) inches in length, with fastenings of metal and wedges to insure a correct, rigid setting.

Forms shall be of the dimension required for the designed cross-section shown on the plans. Built up sections to attain the required depth will not be permitted. Forms shall be set true to the lines and grades established by the Design Engineer or as indicated on the plans.

Forms shall be held rigidly in position and shall be of sufficient strength to resist springing out of line when concrete is placed.

PLACING CONCRETE

Prior to placing concrete, the subgrade shall be moistened and the contact side of the forms shall be cleaned and coated with a heavy oil. The Contractor shall not place any concrete without the forms, reinforcing steel and subgrade being inspected and approved by the Design Engineer. Placing of concrete is to be in accordance with ACI 304 (most recent edition). Water shall be

removed from the excavation before placing concrete and water shall be diverted to prevent washing over freshly deposited concrete.

Concrete shall be placed as not to disturb concrete already in place and in such a manner as to require the minimum amount of lateral movement. Concrete shall be deposited in the forms without segregation. A tremie shall be used when the fall exceeds five (5) feet. Care shall be taken not to upset any forms during the concrete pouring operations. Any concrete showing misalignment due to form movement shall be removed and replaced at no additional cost to the Public Works Commission.

All concrete shall be consolidated in accordance with ACI 309 (most recent edition). Mechanical vibrators shall be operated by experienced workmen. Spading and rodding may be required to supplement mechanical vibration. Consolidation shall be adequate to remove any voids and after removal of the forms, no honeycomb shall be present. Should any honeycomb be present, the Design Engineer shall determine if the honeycomb is of a minor nature, the voids may be filled with mortar as approved by the Design Engineer.

All concrete within forms shall be brought to true section by the use of an approved straight edge and shall be tamped with straight edge to bring mortar to the surface, after which it shall be floated smooth by means of wood floats. No steel floats will be permitted. After true surface of section has been obtained, and after initial set has taken place, the entire surface shall be brushed with a dampened brush. All joints and all exposed edges shall be rounded off with approved jointing and edging tools. The type of finish required will be specified in the specific item of work specified or indicated on the drawings. All exposed surfaces of retaining walls, structures, etc. shall be given a Class 2 finish with $\frac{1}{4}$ inch chamfered edges.

No more concrete shall be laid than can be properly finished and covered during the daylight, unless adequate artificial light satisfactory to the Design Engineer is provided.

Immediately after finishing operations have been completed, the entire surface of the concrete shall be sprayed with an approved curing compound. The use of liquid retarding agents shall conform to standards specified by current AASHTO or ASTM Specifications.

Cold weather concreting shall be in accordance with ACI 306 (most recent edition) and hot weather concreting shall be in accordance with ACI 305 (most recent edition). Concreting shall be done when weather conditions are favorable unless otherwise directed by the Design Engineer. Concrete operations shall be discontinued when the temperature of 40 degrees Fahrenheit is reached on a falling thermometer. No concreting shall be attempted when local weather bureaus indicate temperatures below freezing within the ensuing 24 hours unless proper precautions are made to protect concrete by covering with straw or other thermal insulation satisfactory to the Design Engineer. The Contractor shall be responsible for the quality and strength of the concrete laid during cold weather or hot weather and any concrete damaged by frost action or freezing shall be removed and replaced as directed by the Design Engineer and/or the Public Works Commission at the Contractor's expense.

Forms shall not be removed from the concrete for a minimum of 7 days, unless approved by the Design Engineer. The Contractor shall apply a curing compound or provide measures to maintain moisture for proper curing at his expense, if early form removal is approved. Immediately after the forms have been removed, all honeycomb areas shall be repaired (with one-part cement and

two parts sand) and earth backfill material shall be placed adjacent to the finished concrete and smoothed off to prevent an accumulation of standing water, subgrade saturation or under wash in the event of rain.

Both pedestrian and vehicle traffic shall be excluded from crossing the concrete for a period of 14 days by the erection and maintenance of suitable barricades. Contractor shall be responsible for any damage resulting from traffic within the 14-day period and he shall remove and replace any concrete damaged as directed by the Design Engineer and/or Public Works Commission.

MASONRY MATERIALS

Brick shall be in accordance with ASTM C-32 Grade MS laid in full beds of mortar with shove joints.

Concrete masonry blocks shall be in accordance with ASTM C-139. Blocks shall be at least 5", but not more than 8" in thickness nor less than 8" in length and of such shape that the joints can be effectively sealed and bonded with cement mortar.

Cement mortar for brick work shall be in accordance with ASTM C-270, Type M. Use Type IIA cement in accordance with ASTM C-150.

TESTING

The requirements of ACI318 (most recent edition) shall be used to control the evaluation of all concrete strengths. The strength is to be checked during construction by four (4) cylinders at the option and cost of the Public Works Commission, of which 1 shall be broken at 7 days, 2 at 28 days. If the specified strength is not achieved in 28 days, 1 reserved shall be stored and broken as specified by the Design Engineer. Cylinders shall be made and stored in accordance with ASTM C-13. Cylinders shall be for each day concrete is poured in excess of 10 cubic yards of each different type of concrete, as determined by the Design Engineer. All additional expenses required because of the failure of the materials to meet routine testing requirements, or poorly scheduled concrete deliveries, shall be borne by the Contractor.

END OF SECTION

**DIVISION 2
SITE WORK
09801 - ANTI-MICROBIAL ADMIXTURE**

GENERAL

All reinforced concrete precast manholes shall include a liquid anti-microbial admixture to render the concrete uninhabitable for bacterial growth. The admixture shall be included in the fabrication of the manhole by an approved concrete precast manhole manufacturer. Coatings applied to the interior walls of the manhole shall not be acceptable.

Further, all field mixed mortar, utilized in concrete precast manholes, shall include the anti-microbial admixture. The intent and purpose of this specification is to render all concrete and/or mortar within sanitary sewer service uninhabitable for bacterial growth. Any defects shall be cause for the replacement and correction of such defect as directed by Fayetteville Public Works Commission (PWC), at no expense to Fayetteville Public Works Commission.

RELATED SECTIONS

- B. 02732 – Sewage Force Mains

REFERENCES

- A. ASTM C478 – Standard Specification for Precast Reinforced Concrete Manhole Sections
- B. ASTM C1443 – Standard Specification for Precast Reinforced Concrete Pipe
- C. ASTM C1577 – Standard Specification for Precast Reinforced Concrete Pipe

SUBMITTALS

All submittals shall be provided in accordance with the Contract Documents, and the requirements outlined herein. The Contractor shall submit, in accordance with the Contract Documents, product data, certifications, and product data, to include the following:

1. U.S. Environmental Protection Agency (EPA) registration number.
2. Documentation that the product has a minimum of 10 years of successful prevention of microbial induced corrosion in sanitary sewers.
3. Documentation that the precast facility is certified by the anti-microbial manufacturer.
4. Documentation from the precast facility stating that the correct amount and correct mixing procedure was followed for all anti-microbial concrete.

QUALITY ASSURANCE

A color identifier shall be applied to the interior of each concrete piece fabricated with the anti-microbial admixture. Each piece shall also be plainly stenciled with the name of the anti-microbial admixture on the exterior of each piece.

MATERIALS

All manholes shall conform to PWC standard specifications and details, unless otherwise approved in writing by Fayetteville Public Works Commission. All concrete and mortar utilized in the construction of the manholes shall contain an anti-microbial admixture.

Anti-Microbial Admixture:

The liquid anti-microbial admixture shall be used in accordance with the manufacturer's recommendations. The amount of the admixture shall be included in the total water content of the concrete or mortar mix design. The admixture shall be added to the concrete or mortar mix water, to ensure even distribution of the admixture throughout the concrete or mortar mix. When properly prepared, the anti-microbial admixture shall render the concrete or mortar uninhabitable for bacterial growth.

The anti-microbial admixture shall be ConShield, ConBlock, or approved equal. The ConShield liquid anti-microbial admixture can be obtained from ConShield Technologies, Inc. or an approved precast facility. TheConBlock liquid anti-microbial admixture can be obtained from ConSeal Concrete Sealants, Inc., or an approved precast facility.

Field Repairs:

Field repairs to the precast concrete or mortar shall be in accordance with the admixture manufacturer's recommendations. All field repairs shall be completed in accordance with PWC requirements.

ACCEPTANCE

Acceptance of the concrete and mortar with the anti-microbial admixture shall be based on conformance with the requirements herein, Fayetteville Public Works Commission's review of the installed manhole, and results of all testing.

END OF SECTION

**DIVISION 2
SITE WORK
09802 - SPECIAL COATINGS – CERAMIC EPOXY**

GENERAL

The interior surfaces of all ductile iron pipe and fittings shall be full coated with a ceramic epoxy lining. The ceramic epoxy lining shall be applied to ductile iron pipe free of any other interior lining material. The finish coat shall be applied to yield a minimum dry film thickness of 40 mils for a complete lining.

MATERIALS

The lining material shall be an amine cured novalac epoxy containing at least 20% by volume of ceramic quarts pigment.

The epoxy material shall meet the following minimum performance requirements:

Permeability Rating: 0.00 perms when tested according to ASTM E-96 Procedure A with a test duration of 30 days.

ASTM 6-95 Cathodic Disbandment: 1.5 volts at 77° F.

ASTM B-117 Salt Spray: 0.00 undercutting after one year.

<u>Immersion Testing ASTM D-714</u>	<u>Duration</u>
20% Sulfuric Acid	1 Year
25% Sodium Hydroxide at 140° F	1 Year
160° F Distilled Water	1 Year
120° F Tap Water	1 Year

The above requirements shall be verified and tested by an approved testing laboratory. Copies of the laboratory test showing that the lining conforms to the specifications shall be furnished to the Public Works Commission, certified by the Supplier.

APPLICATION OF LININGS

Surface Preparation: All interior barrel and joint surface areas which will be exposed to the sewer liquids and gases shall be prepared for lining by removing all laitance form oil and other loose, foreign or deleterious materials which would adversely affect the bond of the lining compound of the pipe surface. All areas to receive the protective coating shall be abrasive blasted using compressed air nozzles with sand or grit media. The entire surface to be lined shall be struck with blast media so that all rust, loose oxides, etc., are removed from the surface. Any area where rust appears before lining must be re-blasted.

Qualification of Applicator and Workmen:

The lining shall be applied by a competent firm with a five-year history of lining sewer pipe. The

workmen employed by the applicator shall be experienced and competent in the application and inspection of the lining compound to be applied. The Public Works Commission shall have the right to require the applicator to furnish bonds covering proper performance and guaranteeing the payment of all obligations arising as a result of improper materials and workmanship.

Equipment: All application equipment shall be as recommended by the suppliers of the lining compound.

Application Technique: After the surface has been thoroughly prepared for application, the interior of the pipe shall be coated with the ceramic epoxy to a minimum dry film thickness of 40 mils. No lining shall take place when the substrate or ambient temperature is below 40 degrees F. The surface must be dry and dust free. The number of coats of lining material applied shall be as recommended by the lining manufacturer, but in no case shall it be applied above the dry film thickness per coat recommended by the lining manufacturer. The time between coats shall be that specified by the lining manufacturer.

Repair: All damaged areas or test areas shall be repaired in accordance with the manufacturer's recommendation, so that the repaired areas are equal to the undamaged lined areas in all respects.

Inspection: All pipe linings shall be checked for thickness using a magnetic film thickness gauge, the thickness testing shall be done in accordance with the method outlined in SSPC-PA-2 film thickness rating. The interior linings shall also be tested for pinholes with a non-destructive 2,500-volt test. Any defects found shall be repaired as noted above.

Markings: Each joint, manhole unit, or pipe bend special shall be marked with the date of application of the coating system, the date of inspection, and the numerical sequence of application on that date.

Shipping and Handling: Equipment used to handle and transport the lined pipe shall be suitably designed and operated not to damage the lining. Any damage which does occur shall be repaired prior to the installation of the pipe in accordance with the manufacturer's recommendations, so the repaired area is equal to the undamaged lining in all respects.

END OF SECTION

**DIVISION 2
SITE WORK**

09804 - SPECIAL COATINGS –EPOXY LINING DUCTILE IRON PIPE AND FITTINGS

GENERAL

The interior surfaces of all ductile iron pipe and fittings in sanitary sewer service shall be fully coated with a ceramic epoxy lining. The lining system shall be a two component, amine cured novalac epoxy. The ceramic epoxy lining shall be applied to ductile iron pipe free of any other interior lining material. The finish coat shall be applied to yield a minimum dry film thickness of 40 mils for a complete lining. Any defects in the lining shall result in the pipe or fitting being replaced, at no additional cost to the Public Works Commission.

Unless otherwise specified, references to documents shall mean the documents in effect at the time of bid. If the referenced document(s) have been discontinued by the issuing organization, references to those documents shall mean the replacement documents or the last version of the document before it was discontinued.

Where conflicts exist between the standards and this specification, the more stringent shall apply.

MATERIALS

All ductile iron pipe and fittings shall be in accordance with the Public Works Commission standard specification 02730 – Sanitary Sewer Systems, Public Works Commission standard specification 02732 – Sewage Force Mains, and these Contract Documents.

The lining material shall be an amine cured novalac epoxy containing at least 20% by volume of ceramic quartz pigment (no silica fume, fly ash, or alumina dust). The lining shall be both coal tar (polycyclic aromatic hydrocarbons) free and hazardous air polluting solvents (HAPS) free. The lining system shall be 100% solids by volume.

The ceramic epoxy lining system shall be the Perma-Shield PL Series 431 as manufactured by Tnemec Company, Inc., Permox-CTF as manufactured by Permite Corporation, or approved equal.

The ceramic epoxy lining system shall meet the following minimum performance requirements:

- A. Abrasion (ASTM D 4060, CS-17 wheel, 1,000 grams) – 76 mg loss
- B. Adhesion (ASTM D 4541) – not less than 1,860 psi
- C. Severe Wastewater Analysis Test (150oF, 500 ppm H2S, 4,000 ppm NaCl, 10% sulfuric acid, EIS Permeation Analysis) – Initial impedance of 11.2 (log-z). No blistering, cracking, checking, or loss of adhesion. Reduction in electrical impedance of 0.5 after 28 days of exposure.
- D. Cathodic Disbondment (ASTM G 8, 1.5 V, Classification Group A) – no more than 0.000 inch disbonded equivalent circle diameter.
- E. Dielectric Strength (ASTM D 149) – greater than 600 V per mil
- F. Hardness (ASTM D 2240) – Shore D hardness of 79
- G. Impact (ASTM D2794) – No visible cracking or delamination after 160 inch-pounds direct impact.
- H. Chemical resistance by immersion testing, in accordance with ASTM D 714, as outlined in the following table:

E. 20% Sulfuric Acid at 77° F	F. 2 years, no effect
G. 25% Sodium Hydroxide at 140° F	H. 2 years, no effect
I. 5% Sodium Chloride at 77° F	J. 2 years, no effect
K. Distilled Water at 160° F	L. 2 years, no effect

- I. Salt Spray (ASTM B 117) – No blistering, cracking, rusting, or delamination of film. No rust creepage at scribe after 1,000 hours.

- J. Sag Resistance (ASTM D 4400) – Not less than 90 mills wet film thickness.
- K. Water Absorption (ASTM C 413) – 0.0 percent water absorption
- L. Water Vapor Transmission (ASTM D 1653, Method B, Wet Cup, Condition C) – 1.25 g/m² per 24 hour water vapor transmission and 0.09 perms water vapor permeance.

The above requirements shall be verified and tested by an approved testing laboratory. Copies of the laboratory test showing that the lining conforms to the specifications shall be furnished to the Public Works Commission upon written request and certified by the Supplier.

QUALITY ASSURANCE

The manufacturer of the specified coating system shall have a minimum of 10 years' experience in manufacturing high performance epoxy coating systems. The epoxy coating material shall be from a single manufacturer.

Application of the ceramic epoxy lining system shall be in accordance with the manufacturer's requirements. Preparation of the ductile iron pipe to be lined shall be completed by an installer approved by the lining system manufacturer.

SUBMITTALS

In accordance with these Contract Documents, the Contractor shall submit the following:

1. Manufacturer's certification that the coatings comply with the specified requirements and are suitable for the intended application.
2. Product data sheet.
3. Material Safety Data Sheet.
4. Copies of test data for all the physical, chemical, and permeation properties listed within this specification.

WARRANTY

The ceramic epoxy lining manufacturer shall warranty its products as free from material defects for a period of five (5) years. The Public Works Commission will solely determine whether the pipe should be replaced if any defects are discovered in the lining within the warranty period. All costs to replace the pipe or fitting, including but not limited to, bypass pumping, excavation, and traffic control shall be the manufacturer's responsibility.

APPLICATION OF LININGS

Application of the ceramic lining system shall be completed by an installer approved by the manufacturer of the lining system.

Surface Preparation: All interior barrel and joint surface areas which will be exposed to the sewer liquids and gases shall be prepared for lining by removing all laitance, form oil and other loose, foreign or deleterious materials which would adversely affect the bond of the lining compound of the pipe surface. All areas to receive the protective coating shall be abrasive blasted using compressed air nozzles with sand or grit media. The entire surface to be lined shall be struck with blast media so that all rust, loose oxides, etc., are removed from the surface. Any area where rust appears before lining must be re-blasted.

Qualification of Applicator and Workmen: The ceramic epoxy lining shall be applied by a competent firm with a ten (10) year history of lining sewer pipe. The workmen employed by the applicator shall be experienced and competent in the application and inspection of the lining compound to be applied. The Public Works Commission shall have the right to require the applicator to furnish bonds covering proper performance and guaranteeing the payment of all obligations arising as a result of improper materials and workmanship.

Equipment: All application equipment shall be as recommended by the suppliers of the lining compound.

Application Technique: After the surface has been thoroughly prepared for application, the interior of the pipe shall be coated with the ceramic epoxy to a minimum dry film thickness of 40 mils. No lining shall take place when the substrate or ambient temperature is below 40°F. The surface must be dry and dust free. The number of coats of lining material applied shall be as recommended by the lining manufacturer, but in no case shall it be applied above the dry film thickness per coat recommended by the lining manufacturer. The time between coats shall be that specified by the lining manufacturer.

Repair: All damaged areas or test areas shall be repaired by the lining manufacturer prior to shipment, in accordance with the manufacturer's recommendation, so that the repaired areas are equal to the undamaged lined areas in all respects.

Inspection: All pipe linings shall be checked for thickness using a magnetic film thickness gauge. The thickness testing shall be done in accordance with the method outlined in SSPC-PA-2 film thickness rating. The interior linings shall also be tested for pinholes with a non-destructive 2,500 volt test. Any defects found shall be repaired as noted above. All ceramic epoxy lined pipe and fittings shall be visually inspected for any defects, including runs, sags, or debris within the lining. All repairs shall be performed by the manufacturer prior to shipment.

Markings: Each joint, manhole unit, or fitting shall be marked with the date of application of the coating system, the date of inspection, and the numerical sequence of application on that date.

Shipping and Handling: Equipment used to handle and transport the lined pipe shall be suitably designed and operated not to damage the lining. Any damaged pipe or fitting shall be replaced at no cost to the Public Works Commission.

INSTALLATION

Cutting Pipe: The Contractor shall cut the pipe without damaging the pipe or interior ceramic epoxy coating. All cuts shall be at right angles to the pipe axis. All cut ends shall be dressed with a power grinder to remove all sharp edges. The cut ends of push-on joint pipe shall be beveled in accordance with the pipe manufacturer's instructions. All field cuts shall be coated and sealed

prior to installation. Application of the lining shall be done in accordance with the ceramic epoxy lining manufacturer's recommendations.

Handling: All ceramic epoxy lined pipe and fittings shall be handled only from the outside. No forks, chains, straps, hooks, cables, or other equipment shall be placed inside the pipe and fittings for lifting, positioning, or installation. The pipe and fittings shall not be dropped or unloaded by rolling. The pipe and fittings shall not strike sharp objects while moving or unloaded. Ductile iron pipe shall not be placed on grade utilizing hydraulic pressure from machinery or hammers. The use of nylon straps or other similar lifting devices are to be used.

Pipe Installation: All pipe and fittings shall be installed in accordance with PWC standard specifications 02222 – Excavation, Trenching, and Backfilling for Utility Systems, 02730 – Sanitary Sewer Systems, 02732 – Sewage Force Mains, and these Contract Documents.

INTRODUCTION

Jurisdiction

This MANUAL shall apply to all proposed water systems and assets to be owned, operated or maintained by AQUA NORTH CAROLINA.

Purpose

These standards and specifications are adopted to establish minimum acceptable standards for the design and construction of water distribution/transmission facilities that are to be dedicated to AQUA NORTH CAROLINA or facilities that interconnect to other utilities. Such facilities include water supply, distribution, and miscellaneous related appurtenances associated with such systems. These standards and specifications apply only to approval by AQUA NORTH CAROLINA and not by any state or local authorities.

It is the responsibility of the design ENGINEER to ensure that this specification and/or his amendments (as approved by AQUA NORTH CAROLINA) meet all applicable building codes and governing laws.

Approval by AQUA NORTH CAROLINA does not relieve the ENGINEER from obtaining approval from state or local authorities.

Scope

This document is grouped into five divisions:

Division 1: General Requirements, presents general requirements governing review and approval of plans and construction inspection and acceptance.

Division 2: Design Standards contains all the criteria required for the acceptable design of water mains.

Division 3: Construction Specifications, contains detailed technical specifications governing the construction of water facilities.

Division 4: Standard Details, consists of drawings showing typical installation/construction of water facilities.

Division 5: List of Materials and Approved Manufacturers consists of approved equipment for construction per region.

DIVISION 1

GENERAL REQUIREMENTS

Division 1

Section 1

Definitions

1.1 Definitions

Except where specific definitions are used within a specific section, the following terms, phrases, words and their derivations shall have the meaning given herein when consistent with the context. Words used in the present tense include the future tense, words in the plural number include the singular number and words in the singular number include the plural number. The word "shall" is mandatory, and the word "may" is permissive.

AASHTO - American Association of State Highway and Transportation Officials. Any reference to AASHTO standards shall be taken to mean the most recently published revision unless otherwise specified.

ANSI - American National Standards Institute. Any reference to ANSI standards shall be taken to mean the most recently published revision unless otherwise specified.

ASTM - American Society for Testing Materials. Any reference to ASTM standards shall be taken to mean the most recently published revision unless otherwise specified.

AWWA - American Water Works Association. Any reference to AWWA Standards shall be taken to mean the most recently published revision unless otherwise specified.

CONTRACTOR - the person, firm, or corporation with whom the contract for work has been made by the Owner, the Developer or AQUA NORTH CAROLINA.

COUNTY - the applicable county and/or its designated representative(s).

DEVELOPER - the person, firm or corporation engaged in developing or improving real estate for use or occupancy.

DEVELOPER'S ENGINEER - an engineer or engineering firm registered with the State of North Carolina Board of Examiners for Engineers & Surveyors, retained by the DEVELOPER to provide professional engineering services for a project.

DIPRA - Ductile Iron Pipe Research Association. Any reference to DIPRA standards shall be taken to mean the most recently published revision unless otherwise specified

DRAWINGS - engineering drawings prepared by an ENGINEER to show the proposed construction.

ENGINEER - an engineer or engineering firm registered with the North Carolina Board of Examiners for Engineers & Surveyors.

FM - Factory Mutual. Any reference to FM standards shall be taken to mean the most recently published revision unless otherwise specified

GEOTECHNICAL/SOILS ENGINEER - a Registered North Carolina Engineer who provides services related to terrain evaluation and site selection, subsurface exploration and sampling, determination of soil and rock properties, foundation engineering, settlement and seepage analysis, design of earth and earth retaining structures, the design of subsurface drainage systems and the improvement of soil properties and foundation conditions and testing and evaluation of construction materials.

MANUAL - these Specifications for Water Construction.

MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES - the United States Department of Transportation Manual on Traffic Control Devices, latest edition.

NCBELS – The North Carolina Board of Examiners for Engineers and Surveyors

NCDEQ – the North Carolina Department of Environmental Quality

NCDOT - the North Carolina Department of Transportation

NEMA - National Electrical Manufacturers Association. Any reference to NEMA Standards shall be taken to mean the most recently published revision unless otherwise specified.

NSF - National Sanitation Test Laboratory Foundation. Any reference to NSF Standards shall be taken to mean the most recently published revision unless otherwise specified.

OSHA - the Federal Occupational Safety and Health Administration.

OWNER - the person, firm, corporation, or governmental unit holding right of possession of the real estate upon which construction is to take place.

PLANS - DRAWINGS as defined herein above.

PWS – NCDENR Public Water Supply Section

RULES GOVERNING PUBLIC WATER SYSTEMS: North Carolina Administrative Code, Title 15a, Department of Environment and Natural Resources, Subchapter 18C – Water Supplies – Sections .0100 through .2200, latest edition.

SPECIFICATIONS - the specifications contained in Division 3 of this MANUAL.

STANDARDS - the minimum design standards contained in Division 2 of this MANUAL.

STANDARD DETAILS - the detailed drawings in Division 4 of this MANUAL related to water materials and installation of same.

SURVEYOR - a surveyor or surveying firm registered with the North Carolina Board of Examiners for Engineers & Surveyors.

UL - Underwriters Laboratory.

UTILITY – AQUA NORTH CAROLINA, INC.

WATER MAINS - water transmission mains, distribution mains, pipe, fittings, valves, hydrants, services, meters and miscellaneous related appurtenances.

WORK - the labor, materials, equipment, supplies, services and other items necessary for the execution, completion and fulfillment of the contract.

Division 1

Section 2

Plan Review, Approval, Construction, and Acceptance of Water Improvements

2.1 Plans, Specifications, and Models

- 2.1.1 General: All submitted plans should be a standard size sheet (24" x 36") with title block. Graphic scale(s) shall be provided on each sheet and all lettering shall be 1/8" or larger to permit photographic reproduction. All PLAN sheets and the title page of submitted SPECIFICATIONS, Engineer's Report & calculations must be signed, sealed and dated by the DEVELOPER'S ENGINEER in accordance with the rules and regulations of the NCBELS. All submitted plans, specifications, calculations, reports and any other associated documents will be submitted in hard copy and electronic copy. Electronic copies will be in a standard format of PDF and ACAD (DWG.). Any deviations in format must be preapproved by the UTILITY.
- 2.1.2 Master Plan: The entire water system shall be shown on a single Master Plan. For systems where the UTILITY is the owner and operator of both the water and wastewater systems, the entire water and wastewater systems will be shown on a single Master Plan. The Master Plan shall indicate the general locations of all mains, manholes, valves, hydrants, services and service laterals with respect to the proposed development improvements and the existing water and wastewater systems. Main sizes shall be indicated on the Master Plan.
- 2.1.3 Plan and Profile: All water mains shall be drawn in plan and profile. Any occurrence of phased construction should be clearly represented on the plan sheets upon submission to UTILITY for review.

Whenever possible, on-site water and wastewater systems shall be shown on the same PLAN sheet. As a minimum, the plan and profile drawings shall include the following information:

1. General information such as north arrow, names of designer and engineer, revision block with dates, graphic scale(s) and sheet number.
2. Profile with elevations at 10-foot interval, or more frequently if required by good design practice.
3. Development layout with horizontal and vertical controls.
4. All conflicts with other utility and drainage systems, including clearances.
5. Pipe data including size, lengths, class, and material.

6. Size, type, and locations of fittings, valves, hydrants, air release/vacuum relief valves and other related appurtenances.
 7. Limits of pipe deflection.
 8. Limits of special exterior coatings.
 9. Limits of special bedding requirements.
 10. Pipe restraint requirements.
 11. Details of connection to existing systems.
 12. Construction notes regarding cover, horizontal and vertical control, special construction requirements, and references to standard and special details.
- 2.1.4 Details: The PLANS shall include all applicable STANDARD DETAILS as shown in Division 4 of this MANUAL. Special details shall be prepared by the DEVELOPER'S ENGINEER for aerial and underwater crossings of rivers, streams, canals and ditches. Other special details shall be prepared by the DEVELOPER'S ENGINEER as required.
- 2.1.5 Scale: The master plan shall be prepared at a scale not to exceed 1" to 200'. Plan and profile sheets shall not exceed a scale of 1" to 50'. Special details shall be of sufficiently large scale to show pertinent construction information. On especially large systems, a larger scale can be used with the permission of UTILITY, or an overall plan of a greater scale can be used as long as smaller scale plans are also provided.
- 2.1.6 Hydraulic Modeling: A hydraulic model utilizing WaterCAD or WaterGEMS may be required for all new systems planning to provide irrigation, containing 2 wells or more or for any system connecting to a master system. On single well system, the Utility reserves the right to require modeling to verify pressure and flows. If the proposed system is to be connected to an existing system, the entire interconnected system shall be modeled. Contact UTILITY's engineer to determine if the model will be required. If a system provides fire flow, additional modeling may be requested.
- 2.1.6.1 If a hydraulic model already exists for the system being connected to, the DESIGNER, with the permission of the UTILITY, may provide a hydraulic model of the proposed system to be placed in the existing model. In this case, UTILITY shall provide pressure and flow data for the system being connected to.
- 2.1.7 General Notes: All drawings will have these notes somewhere in the set:
- Aqua North Carolina shall be notified 72 hours before construction is to begin.
 - Aqua North Carolina shall be notified 72 hours before any construction is buried.
 - Aqua North Carolina shall be notified 48 to 72 hours before any testing is conducted
- 2.1.8 Project Summary: A summary of the project will be included with the submittal. The submittal will include the following information, at a minimum. This summary can be combined with the Engineer's Report.

- Project name and location.
- Water system name and PWSID (if connecting to existing system).
- A brief description of the project.
- The number of proposed connections.
- All proposed wells/water sources with capacity and proposed storage (if applicable).

2.2 Subdivision Related Water Improvements

- 2.2.1 General: This section covers all water improvements that are dedicated to UTILITY.
- 2.2.2 Design and Plan Review: Design of water improvements associated with UTILITY approved projects shall be in compliance with the DESIGN STANDARDS in Division 2, and the SPECIFICATIONS outlined in Division 3 of this MANUAL. PLANS will be reviewed and approved by UTILITY as part of the project review and approval process. Any occurrence of phased construction should be clearly represented on the plan sheets upon submission to UTILITY for review.
- 2.2.3 Preconstruction Meeting: A preconstruction meeting will be required before work begins on any project. The meeting will consist of, at minimum, the DEVELOPER'S ENGINEER, the CONTRACTOR, and a representative of UTILITY. Other attendees can be required by UTILITY as needed, including any subcontractors and regulators. It shall be the CONTRACTOR's responsibility to contact any local and state regulators to see if their presence is required at the preconstruction meeting.
- 2.2.4 Construction Inspection: DEVELOPER's ENGINEER shall periodically inspect all construction subject to these STANDARDS and SPECIFICATIONS.

After all required improvements have been installed; the DEVELOPER'S ENGINEER shall submit certification to UTILITY that the improvements have been constructed substantially in accordance with approved PLANS and SPECIFICATIONS. A walkthrough of the improvements by the DEVELOPER'S ENGINEER and a representative of UTILITY to ensure compliance with the PLANS and SPECIFICATIONS will be required before closing. Non-compliance with approved PLANS or SPECIFICATIONS or evidence of faulty materials or workmanship shall be recorded by the DEVELOPER or DEVELOPER'S ENGINEER and if not corrected in an expeditious manner, all work on the project will be suspended and service withheld. **DEVELOPER'S ENGINEER is responsible for all inspections and certifications.**

2.3 Compliance with other Regulatory Requirements

- 2.3.1 It shall be the responsibility of the DEVELOPER to obtain and comply with all applicable Federal, State and Local regulatory requirements.
- 2.3.1.1 **SPECIFICALLY HIGHLIGHTED:**

15A NCAC 18C .1537 DRINKING WATER TREATMENT CHEMICALS AND SYSTEM COMPONENTS

- (a) The standards established by the American National Standards Institute/NSF International, codified as ANSI/NSF Standard 60 and ANSI/NSF Standard 61, are incorporated by reference including subsequent amendments and editions. ANSI/NSF Standard 60 applies to drinking water treatment chemicals. ANSI/NSF Standard 61 applies to drinking water system components. Copies may be obtained for public inspection as set forth in Rule .0503 of this Subchapter.
- (b) A water supply product used in a public water system shall meet the standards incorporated by reference in Paragraph (a) of this Rule. A product certified by an organization having a third-party certification program accredited by the American National Standards Institute to test and certify such products may be used in a public water system.
- (c) A supplier of water shall maintain a list of all water supply products used in a public water system for inspection by the Department. Prior to using a product not previously listed, a supplier of water shall either determine the product is certified as required by Paragraph (b) of this Rule or notify the Department of the type, name, and manufacturer of a product.
- (d) A supplier of water shall not introduce or permit the introduction of a water supply product into a public water system that does not meet the requirements of this Rule.

2.3.2 Acceptance of the PLANS by the UTILITY does not imply acceptance of the PLANS by any state or local authorities. It is the responsibility of the ENGINEER to submit the PLANS to all required agencies and to obtain any approvals necessary before construction is to begin.

2.4 Guidelines for the Acceptance of New Water Mains from Contractors

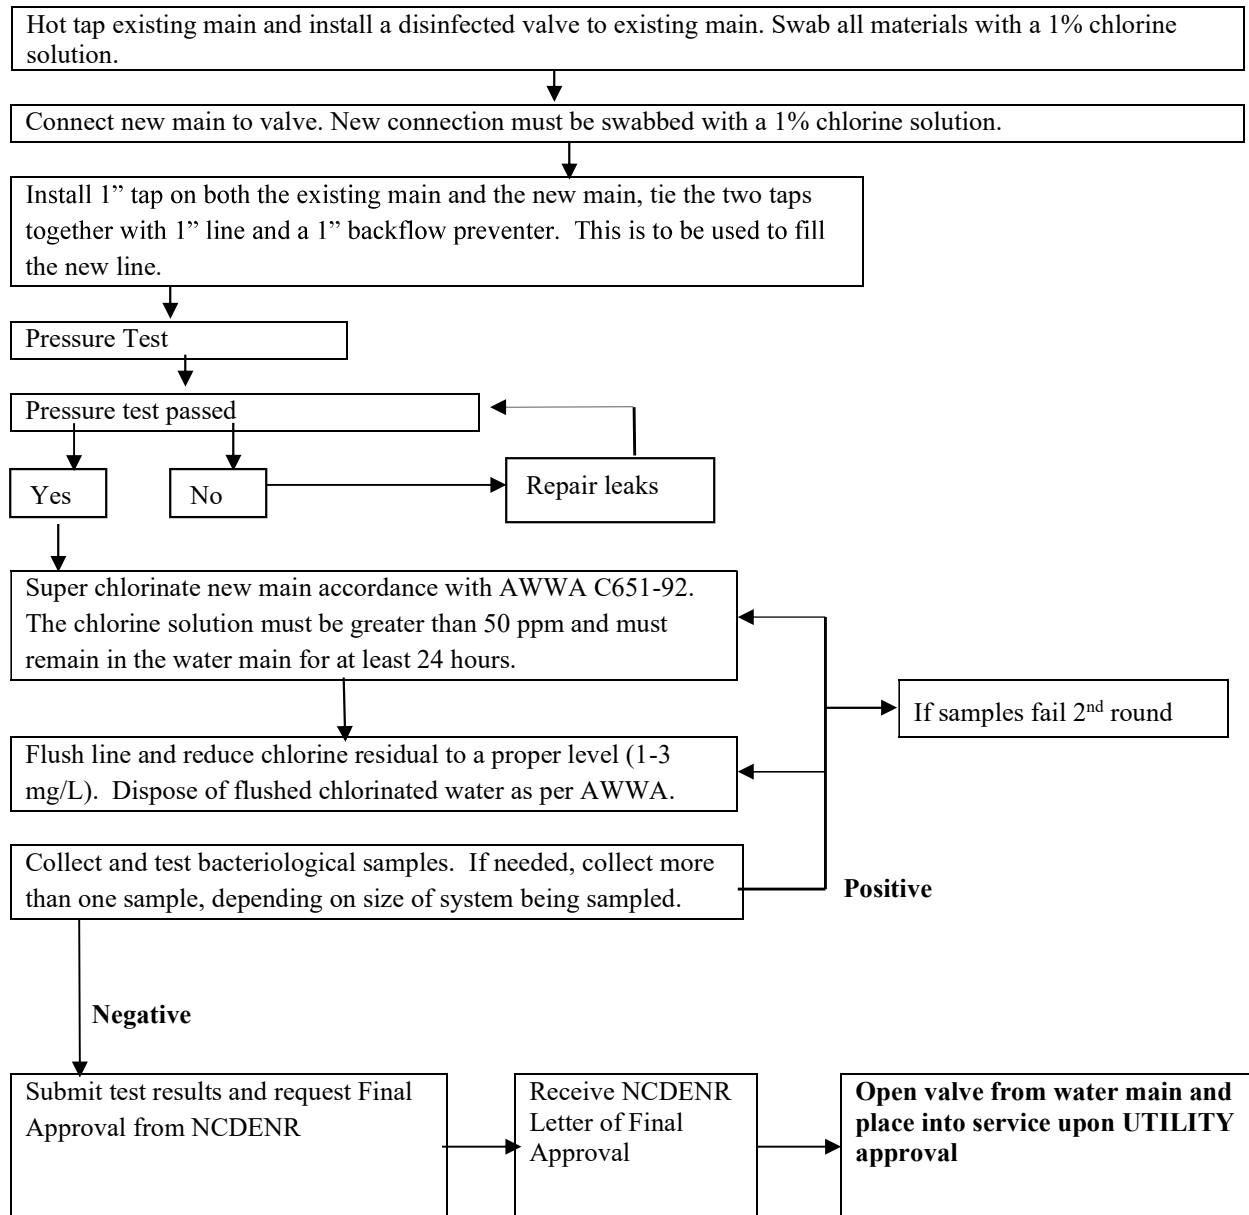

General: UTILITY as a purveyor of clean and high-quality water is responsible to prevent or minimize the exposure of its customers to any possible risk of chemical or microbiological contaminants that may result in illness to the community.

This document, which is in a flow chart format, is based on AWWA standard policies, practices, and procedures for accepting new water mains and is addressed to both internal operation personnel and outside contractors. The purpose of these guidelines is to provide a step by step procedure delineating the construction and final clearance of water main extensions.

It applies to all UTILITY facilities. All contract or operations employees are responsible and required to follow these procedures. Construction inspectors and supervisory employees will be responsible for ensuring compliance.

Incorporated Reference: ANSI/AWWA C651-92

GUIDELINES FOR THE ACCEPTANCE OF NEW WATER MAINS FROM CONTRACTORS

2.5 Engineering Design Requirements

- 2.5.1 NCDENR Application for Approval: NCDENR Application for Approval on Engineering Plans and Specifications shall name UTILITY as applicant.
- 2.5.2 Easements: PLANS shall clearly show and label all access and utility easements for any portion of the water system not within publicly dedicated rights of way, including any construction easements needed for the project.
- 2.5.3 NCDENR Submittal Documents: All applicable documents listed in the table below shall be provided by the project’s ENGINEER for UTILITY’s review prior to applying for NCDENR approval for Authorization to Construct.

Table 2.5.4

1	1 hard copy and 1 ‘.pdf’ set of Design Drawings.
2	1 copy and 1 PDF of the NCDENR Checklist for New Well Construction, sealed by the ENGINEER (see attached, this section).
3	1 hard copy and 1 ‘.pdf’ copy of Engineer’s Report, completed in the format approved by NCDENR pursuant to the RULES GOVERNING PUBLIC WATER SYSTEMS, sealed by the ENGINEER.
4	1 copy and 1 ‘pdf’ copy of the Project Summary.
5	1 copy and 1 ‘.pdf’ set of all water system design calculations, sealed by the ENGINEER.
6	1 copy and 1 ‘.pdf’ set of all well construction reports and testing reports for each well in the water system, if any.
7	1 copy and 1 ‘.pdf’ set of all project specification sheets and MSDS sheets
8	1 copy and 1 PDF of the NCDENR Application for Approval of Engineering Plans and Specifications for Water Supply Systems.
9	1 copy and 1 ‘.pdf’ set of the well lot survey for each well lot in the water system showing the well head location, the 100’ radius from the center of the well head and the 20’ access and utility easement to each well lot that does not front upon publicly dedicated rights of way, sealed by the SURVEYOR, if any.

2.6 Project Completion and Acceptance

UNDER NO CIRCUMSTANCES SHALL AQUA SUPPLY WATER UNLESS ALL OF THE FOLLOWING ITEMS ARE COMPLETED:

A – The Engineering Certificate is completed and submitted

B – All appropriate information is supplied so that an Applicant’s Certificate can be executed, is executed and submitted

C – Aqua receives appropriate Final Approval from all applicable regulatory agencies

D – All appropriate documents are supplied for the Closing Documents and the documents executed

- 2.6.1 **Project Documentation:** All applicable documents shall be provided prior to project’s acceptance by UTILITY and prior to placing the water system in service. The format for these document submissions will be 1 hard copy and 1 PDF and 1 DWG (for drawings)
- 2.6.2 **Backflow Prevention Inspection Report and Testing:** CONTRACTOR is responsible for providing all reports and testing results per most current PWS rules and regulations.
- 2.6.3 **As-Built Inspection:** ENGINEER is responsible for scheduling field inspection/site visits by UTILITY prior to UTILITY’s acceptance of the project.
- 2.6.4 **ENGINEER’s Final Completion Package:** Documents listed in the table below shall be provided by the ENGINEER.

Table 2.6.5

1	Water system pressure and leakage test results and bacteriological analysis results.
2	ENGINEER’s Electronic Record Drawings for the project, which shall include the longitude and latitude of each valve, fire hydrant, meter, etc, in ‘.dwg’ format, AutoCAD Release 14 minimum, 2000, or 2000i
3	1 copy and 1 ‘.pdf’ set of ENGINEER’s signed and sealed Record Drawings for project

4	ENGINEER's Letter of Certification of Completion (signed, sealed, and dated) for the project. The original to be sent by the ENGINEER to NCDEQ.
---	---

2.6.6 Record Drawings: The DEVELOPER's ENGINEER shall submit a certified set of Record Drawings sealed by the Engineer prepared in conjunction with a North Carolina Licensed Professional Land Surveyor to ensure proper locations and coordinates of built and installed devices/facilities to UTILITY prior to acceptance of the project. The DEVELOPER's ENGINEER shall be responsible for recording information on the approved PLANS concurrently with construction progress. Record Drawings submitted to UTILITY, as part of the project acceptance shall comply with the following requirements:

- Record Drawings shall be legibly marked to record actual construction.
- Record Drawings shall show actual location of all underground and aboveground water and wastewater piping and related appurtenances (Plan and profile). For systems where UTILITY is the owner and operator of both the water and wastewater systems, the entire water and wastewater systems Record Drawings shall show all underground and aboveground water and sewer piping and related appurtenances. All changes to piping location including horizontal and vertical locations of utilities and appurtenances shall be clearly shown and referenced to permanent surface improvements. DRAWINGS shall also show actual installed pipe material, class, etc.
- Record Drawings shall clearly show all field changes of dimension and detail, including changes made by field order or by change order.
- Record Drawings shall clearly show all details not on original contract drawings but constructed in the field. All equipment and piping relocation shall be clearly shown.
- Location of all hydrants, meters, meter boxes, valves, and valve boxes shall be shown. A benchmark shall be shown on the plan referencing the state plane coordinate system.
- Record Drawing format shall be georeferenced .DWG file and .PDF.

Each sheet of the PLANS shall be signed, sealed and dated by the DEVELOPER'S ENGINEER as being "Record Drawings." Construction PLANS simply stamped "As-Built" or "Record Drawings" and lacking in the above requirements will not be accepted and will be returned to the DEVELOPER'S ENGINEER. The NCDENR "Applicant Certification" for Final Approval will not be released until correct "Record Drawings" have been submitted.

AQUA CHECKLIST for NEW WELL CONSTRUCTION Date: _____

Name of Public Water System: _____

Public Water System Identification number (PWSID) if known: _____

County: _____ Well name or number: _____

Engineer: _____

Well Driller's name: _____ Driller's Cert. number: _____

Casing: Length installed: _____ Type of Casing installed: _____
(should be 50 ft. minimum below grade)

Casing should be grouted full length. Length of Casing Grouted: _____

Grouting Method Used:
Pressure Method: _____ Pumping Method: _____ Other: _____

Well Site Deed(s) enclosed? (Y / N) Recorded Plat(s) enclosed? (Y / N)

Drive shoe used on bottom of well casing? (Y / N)

Signed well driller's log with driller's certification number (Y / N)

Monitoring: Bacteriological Analysis (Y / N) VOC Results (Y / N)

"New Well" Inorganic Results (Y / N) SOC Results (Y / N)

Radiological (if required) (Y / N) Asbestos (if required) (Y / N)

Nitrate/Nitrite (if not included in Inorganic Analysis) (Y / N)

Signed 24-hour well yield and drawdown report enclosed? (Y / N)

Engineer's well construction verification statement sealed and signed? (Y / N)

Total dynamic head design calculations? (Y / N)

Selected pump data and performance curves? (Y / N)

3 sets of "Application for Approval"? (Y / N)

Well site approval letter? (Y / N)

By signing and sealing the below, the Engineer certifies that he/she or someone under his/her direct control was present for the drilling of the subject well. If not he/she certifies and provides a video investigation record/log of the new well submitted with these documents.

Engineer's Seal & Signature:

DIVISION 2

DESIGN STANDARDS

Design Standards

Division 2

Section 1

Aqua North Carolina Daily Flows

1.1 Design Demand

- 1.1.1 DEVELOPER'S ENGINEER must confirm demands per RULES GOVERNING PUBLIC WATER SYSTEMS, latest edition. Demand calculations must be done according to these standards, Division 2, Section 5.3.2, or in accordance with the demand listed in the Developer's Agreement with UTILITY, whichever is more stringent.

Division 2

Section 2

Well Sites

2.1 Location

2.1.0 **Stormwater credits and/or allowances:** For each individual well, whether multiple wells are located on the same lot or not, the developer shall place into Aqua's name/for Aqua's future use/ at Aqua's disposal adequate stormwater credits/permissions to construct up to a minimum net 7,850 square feet of impervious surface.

2.1.1 For approval, NCDENR and/or UTILITY rules require that **minimum** horizontal separation between public water supply wells and known potential sources of pollution be maintained as follows:

A. 100 feet from:

- Any sanitary sewage disposal system or sewer pipe;
- Any subsurface disposal area, disposal tank, leach field or filter backwash;
- Buildings, storage facilities, permanent structures, animal lots, or cultivated areas where chemicals are applied;
- Surface water;
- Chemical or petroleum fuel underground storage tanks with secondary containment;
- Any roads other than the well access road;
- Any other potential sources of pollution such as power transformers.

Well sites down grade from individual septic tanks, near the 100' radius, are usually not accepted by NCDENR.

B. 200 feet from:

- A subsurface sanitary sewage treatment and disposal system designed for 3000 gpd or more.

C. 300 feet from:

- A cemetery or burial ground

D. 500 feet from:

- A septage disposal site;
- Chemical or petroleum fuel underground storage tanks without secondary containment; including underground pipelines for transmission of petroleum products (cross-country).

- A boundary of a groundwater contamination area;
- A sanitary landfill or non-permitted non-hazardous solid waste disposal site.

E. 1000 feet from:

- A hazardous waste disposal site.

2.1.1.1 The well shall not be located in an area generally subject to flooding.

2.1.1.2 Note that NCDENR may require greater separation distances or impose other protective measures when necessary to protect the well from pollution (see RULES GOVERNING PUBLIC WATER SYSTEMS, section .0203, Public Well Water Supplies for more detail).

2.1.2 Well sites with drainage ditches or low spots capable of holding water within the 100' radius will not be accepted by the UTILITY.

2.1.3 Well site shall be approved by NCDEQ and a UTILITY Representative prior to drilling. Final approval of well site shall be dependent upon satisfactory completion of any NCDEQ and UTILITY provisos.

2.1.4 A certified survey of the well lot shall be provided prior to submittal for NCDEQ plan approval. The survey shall include topographic information. The coordinates of the well and county pin number shall be provided for each well drilled.

2.1.5 The well lot must be owned or controlled by the UTILITY. Developer shall provide Utility with an appropriate recorded deed of easement and/or general warranty deed which shall include well protective non-contamination provisions acceptable to UTILITY to ensure the required 100' radius is pollution-free. Said deed must be in the UTILITY's name and shall be recorded at the county's register of deed office prior to submittal for NCDENR plan approval and UTILITY accepting the well. A 20' utility and access easement shall also be granted to UTILITY.

Division 2

Section 3

Design Criteria for Pumps & Motors

3.1 Submersible Motors

- 3.1.1 Motors shall be manufactured by Franklin or Centri-pro and of the highest psi thrust bearing available. Any other manufacturer must be approved by UTILITY.
- 3.1.2 Three-phase power is required for sites. DEVELOPER and ENGINEER shall investigate the possibility of making three-phase power available before specifying a single-phase motor.
 - 3.1.2.1 On anything less than 10 hp, UTILITY may allow single-phase power.
- 3.1.3 Three phase motors 15 hp – 25 hp shall have a No. 8 pig tail or motor connector. The size pig tail or motor connector for larger motors shall be determined by the manufacturer.
- 3.1.4 All motors shall be new; remanufactured motors shall not be accepted.
- 3.1.5 The ENGINEER shall design the proper size drop wire in accordance with the latest Franklin or Century installation guide or the one provided with an equivalent motor used.
- 3.1.6 After motor is set in place, an insulation test shall be performed to ensure there are no shorts or grounds in the drop wire or motor. If grounds or shorts are found, the contractor will replace the drop wire and/or motor at no cost to the owner.
- 3.1.7 There shall be at least 20' of drop cable left out of well.
- 3.1.8 The appropriate 3-phase motor protection shall be provided as specified by UTILITY for the area served.
- 3.1.9

3.2 Submersible Pumps

- 3.2.1 Pumps shall be manufactured by Goulds or Grundfos (see Division 5, Section 1.2.2) unless otherwise designated by UTILITY.
- 3.2.2 The pump size and type shall be designed by the ENGINEER and approved by the UTILITY.
- 3.2.3 All pumps shall be set on galvanized pipe or approved equal, of the size approved by UTILITY, unless weight will not allow it. When galvanized drop pipe is not feasible Shur-Align PVC drop pipe shall be allowed upon engineering approval.

- 3.2.4 An inline spring check valve shall be installed at the pump. A pump set 300' or more shall have a second check valve of the same type, installed halfway up the drop pipe.
- 3.2.5 A ¼", polyethylene line of sufficient psi rating to overcome the static pressure shall be installed with pump. One end shall be just above the pump and the other end left out of well at least 30'. The tube shall be continuous with no couplings or cuts.
- 3.2.6 A galvanized "tee" shall hold the pump on the well seal.
- 3.2.7 A well seal of the proper size shall be used complete with an approved well vent of the steel type.
- 3.2.8 If the drop pipe is 2 1/2" or larger, the well seal shall be steel and made with a solid top.
- 3.2.9 The pump setting depth shall be based on fracture locations and stabilized pumping level and is to be reviewed by a Professional Geologist or ENGINEER.
- 3.2.10 Install a 1" (minimum) PVC pipe from the top of the well down to the level of the pump for determining water drawdown depth by acoustic or manual sounding.

3.3 Booster Pumps and Motors

- 3.3.1 Booster pumps shall be manufactured by Goulds or Grundfos (see Division 5, Section 1.2.3) unless otherwise designated by UTILITY. The pump size and type shall be designed and/or approved by UTILITY. It shall be designed to pump the specified amount of gallons per minute at the specified pressure.
- 3.3.2 Motors for the pumps shall be of the manufacturer, horsepower, voltage, phase and hertz as specified or approved by the UTILITY.
- 3.3.3 Dual pumps with alternating, lead-lag and all necessary controls shall be installed.
- 3.3.4 Pumps shall be mounted on concrete pedestals at least 4" in height, with 4" over hang from each side of the pump, out of 3000 psi concrete. Lag bolts of the proper size shall be inserted in the concrete to mount the pump with. An 8" rubber matting shall be installed between the concrete and the pump base.
- 3.3.5 To prevent air-logging, each pump shall be equipped with an air release valve mounted on the highest point in the pump chamber. This air release will also have sanitary vent attached to it.
- 3.3.6 Either a flange or union shall be used at both the inlet and discharge piping where it enters the pump.
- 3.3.7 Each pump shall be equipped with a swing check valve of the specified type in the discharge side piping.
- 3.3.8 A gate or ball valve shall be installed in both the inlet and outlet piping. Gate valves shall be a rising OS&Y valve.
- 3.3.9 A tee with a ¼ inch ball valve with WOG rating of 600 psi shall be installed on both the intake and discharge side of the pump.

Division 2

Section 4

Water Treatment

4.1 Chemical Equipment

- 4.1.1 A chemical pumping system complete with chemical pumps, solution tanks, tubing, injectors and shelf shall be provided at each treatment location.
- 4.1.2 Chemical pumps shall be 115 VAC of appropriate pressure and flow design requirements, or as specified by UTILITY, specified heads complete with foot valves and injectors or equivalent. Manufacturers' specific recommendations for components designed for the application of all chemicals shall be followed.
- 4.1.3 Solution tanks shall be specified by the UTILITY.
- 4.1.4 Three tees will be installed in valve bank after the check valve to accommodate chemical feed points with an 18" minimum separation between the phosphate and caustic feeds and 5 feet of separation between the phosphate and chlorine feeds. If specified, the phosphate feed point and caustic feed point should be placed immediately after the check valve and the chlorine feed point should be placed past the master meter for the best results.
- 4.1.5 To achieve optimum corrosion control, UTILITY may specify pH adjustment above the state minimum pH of 6.5. Required safety features for wells with caustic feeds include caustic relays wired into the starter and a flow switch installed along a straight section of valve bank at least 12" from an ell. A low flow - flow switch is required on wells producing less than 15 gpm and flow switch will be used on wells producing in excess of 15 gpm.
- 4.1.6 The chemical shelf shall be wall mounted, a minimum size of 2" x 12" x 4', and made of chemical-resistant material with two 10" x 12" shelf brackets and mounted 42" above finished floor to the top or as specified by UTILITY.
- 4.1.7 A Separate chemical feeder shall be used for each chemical applied.
- 4.1.8 Three separate duplex GFCI outlets with separate individual feed circuits/wiring from the electrical control panel shall be provided for the chemical feeders. For Clarification See standard details – specifically W-32A Typical Well House Wiring Diagram. Each duplex outlet will be a GFI/GFCI outlet.

4.2 Filtration Requirements

- 4.2.1 All filtration/contaminant removal and/or waste disposal systems shall be designed by a licensed Professional Engineer, in cooperation with representatives of the UTILITY. These systems will be the sole discretion of the Utility and must be approved before

installation and implementation.

- 4.2.2 When the raw water quality from a new well exceeds the EPA, State Maximum Contaminant Levels (MCL's), or as otherwise discussed within these specifications, provision shall be made, in the well house and lot design and construction, for the addition of physical treatment and, potential waste disposal if approved by the UTILITY (see Division 2, Section 4.3).
- 4.2.3 All water filtration facilities will be equipped with radio controls/telemetry and programmed logic controls (PLC). Radio controls/telemetry shall be provided by UTILITY.
- 4.2.4 Water softening Treatment will only be allowed when there is a receiving sewer with a wastewater treatment plant approved to receive the Water Softening Treatment backwash.

When the receiving sewer is not owned or operated by the Utility (Aqua), a flow acceptance letter must be provided for the discharge

- 4.2.5 Waste Disposal Facilities: Recycle systems are required in accordance with all applicable laws including Federal, State and Local; but when not permissible: sewer, sub-surface, or stream discharge waste disposal methods are also acceptable, when permitted by the appropriate regulatory agencies. With the exception of onsite Recycle and Sludge disposal systems, all waste treatment facilities will be located outside of the well head protection radius and will be separated from the water treatment facilities by an air gap to prevent cross connection. Sub-surface disposal methods will require a repair area close enough to be dosed from the original waste treatment and disposal facilities.
 - 4.2.5.1 When applicable, a flow equalization/settling tank will be installed prior to any sand bed filters. Tank capacity will be sufficient to contain, at least, two complete waste cycle discharge volumes. No "septic" type tanks set above surrounding grade will be allowed.
- 4.2.6 An Operation and Maintenance Manual for the water treatment facilities will be provided to the UTILITY. This Manual will document the basic operation and maintenance issues and procedures for each equipment item and provide schedules for completion of routine tasks.
- 4.2.7 Start-up, Testing, and Operation: Project reports for treatment facilities will be provided to the UTILITY and must include schedules and performance standards for start-up, testing, and (initial) operation. Schedules should include the anticipated start-up date and proposed testing duration. Performance standards should include reference to applicable regulations and specific equipment capabilities.

4.3 Water Quality Parameters

- 4.3.1 Iron (Fe): For any concentration below 0.3 mg/L, a sequestering agent shall be required. The polyphosphate required will be at Utility specification.
- 4.3.2 Manganese (Mn): For any concentration below 0.05 mg/L a sequestrant shall be required. The polyphosphate required will be at Utility specification. At concentrations

greater than 0.30 mg/L, Mn filtration or approved equivalent will be required.

- 4.3.3 If the Fe & Mn Combined Levels exceed 0.50 mg/L, or if the Mn levels are greater than .3 Mn filtration or approved equivalent for removal of iron and manganese will be required unless the Engineer submitting on behalf of the developer and/or Aqua can justify and explain how sequestering will be successful. At minimum, the explanation will include dosing and chemical feed calculations and show how the insoluble portion of Fe and Mn will be less than the current sMCL. . If the engineer of record provides an explanation it is required to receive approval from NCDEQ-PWS Plan Review Section. Failure to receive NCDEQ_PWS approval will require filter installation. Under no circumstances will the Fe & Mn combined levels exceed 1.0 ppm without installation of iron and manganese filters.
- 4.3.4 Separate samples will be required for both soluble and insoluble Fe and Mn when concentrations are detected.
- 4.3.5 Sulfates: At or greater than 250 mg/l will require treatment and backwash permitting.
- 4.3.6 Total Dissolved Solids (TDS): At 500 mg/L or greater treatment shall be required.
- 4.3.7 Radionuclides levels are at 75% of the maximum contaminant levels, Filtration is required. An Alternative is to resampling at a schedule of four (4) hours, eight (8) hours, and twelve (12) hours at the permitted pumping rate. If these results are less than 75% of the maximum contaminant level, treatment will not be required.

Division 2

Section 5

Water Mains and Appurtenances

5.1 General Considerations

- 5.1.1 Type of Water Mains: UTILITY will approve PLANS for water supply mains and extensions only when such mains are designed and constructed in accordance with the criteria set forth in this MANUAL.
- 5.1.2 Design Period: Water mains shall be designed for the estimated ultimate tributary population. Water systems shall be designed to satisfy the domestic water demand requirements for the area.
- 5.1.3 Location: Water mains shall be located in dedicated rights-of-way or utility easements. When installed in rights-of-way, water mains shall, in general, maintain a consistent alignment with respect to the centerline of the road. All water mains located outside of dedicated rights-of-way shall require a minimum 20-foot easement with a 5' on either side of the main clear of any other parallel utilities. Additional easement widths shall be provided when the pipe size or depth of cover so dictate. If a water main is located adjacent to a road right-of-way, a minimum 10-foot easement shall be provided. Additional easement widths shall be provided, if the pipe size or depth-of-cover dictates. Water mains shall not be placed under retention ponds, tennis courts, or other structures. In addition, water mains shall not be located along side or rear lot lines.
- 5.1.4 Construction Easements: All construction easements must be shown on the PLANS.

5.2 Design Basis

- 5.2.1 Hydraulic Modeling: A hydraulic model utilizing WaterCAD or WaterGEMS will be required for all new systems containing 2 wells or more or for any system connecting to a master system. If the proposed system is to be connected to an existing system, the entire interconnected system shall be modeled.
 - 5.2.1.1 If a hydraulic model already exists for the system being connected to, the DESIGNER, with the permission of the UTILITY, may provide a hydraulic model of the proposed system to be placed in the existing model. In this case, UTILITY shall provide pressure and flow data for the system being connected to.
- 5.2.2 Average Daily Flow and Peak Flows: Average daily water flow shall be calculated by referencing the Water-Table of Daily Flows for Various Occupancies (Section 1). Maximum daily water flow shall be calculated as two times the average daily water flow and the peak hourly water flow shall be calculated as four times the average daily water flow.

- 5.2.3 Engineer's Report and Design Calculations: DEVELOPER'S ENGINEER shall submit signed, sealed and dated Engineer's Report and design calculations with the PLANS for all water distribution projects. Calculation shall show the water mains will have sufficient hydraulic capacity to transport peak hourly flows while meeting the requirements of Part 1, Division 2, Section 5.3.1 (below). Head losses through meters and backflow devices shall also be included in calculations. The Engineer's Report shall comply with the forms and guidelines given in the RULES GOVERNING PUBLIC WATER SYSTEM (Section .0307, Engineer's Report, Water System Management Plan and Other Plans). Any Engineer's Report that does not follow these guidelines may be rejected by the UTILITY.

5.3 Details of Design and Construction

- 5.3.1 Pressure: All water mains shall be designed in accordance with Section 5. The system shall be designed to maintain a minimum pressure of 40 psi at all points in the distribution system under all conditions of flow. Higher pressures may be required at commercial, industrial and high-density residential areas. The minimal normal working pressure in the distribution system shall be approximately 55 psi, but in no case less than 40 psi on the customer side of a meter. For pressures greater than 90 psi special provisions may be required. Design Friction Loss calculations for water mains shall be submitted with plans. AWWA Diurnal and a hydraulic model will be required to prove these requirements are met.
- 5.3.2 Design of Wells: Residential well capacity shall be based on a minimum of 1.0 gpm per residential connection, unless stated otherwise in the developer's agreement. Well capacity within the Bayleaf Master Water System (NC0392373) shall be based on a minimum of 1.5 gpm per residential connection. If PWS requirements or if a greater amount is given in the Developer's Agreement, the more stringent amount shall be used instead.
- 5.3.3 Design of Hydropneumatic Storage: When calculating the required effective and total volume, the Tank size shall be based on the North Carolina Public Drinking Water Regulations.
- 5.3.4 Diameter: Four-inch through 54-inch diameter water mains shall be allowed. As a minimum, four (4) inch-looped systems shall be required in low-density, residential projects. Where looping of mains is not practical, minimum six (6) inch mains shall be required, unless detailed calculations are submitted to substantiate the sufficiency of a smaller main (four (4) inch mains are allowed on the last 400' of a dead-end line). In commercial, industrial, and high-density residential areas, minimum eight (8) inch looped mains shall be required.
- 5.3.5 Dead Ends: In order to provide increased reliability of service and reduce head loss, dead ends shall be minimized by making appropriate tie-ins whenever practical, as determined by UTILITY.

Where dead end mains occur, they shall be provided with a hydrant or with an approved flushing hydrant or blow-off for flushing purposes. Flushing devices shall be sized to provide flows with a velocity of at least 3 feet per second in the water main being flushed. No flushing device shall be directly connected to any sewer or irrigation system. Calculations and a hydraulic model will be required to prove these requirements are met.

- 5.3.6 Valves: All Valves with be clock-wise closed and counter clock-wise open. Valves shall be provided on water mains so that sanitary hazards will be minimized during repairs. Valves shall be located at not more than 500-foot intervals in commercial, industrial and high-density residential areas and at not more than 1,000-foot intervals in all other areas. Valving shall be placed at all areas where water mains intersect in such a way as to ensure effective isolation of water lines for repair, maintenance or future extension.
- 5.3.7 Separation of Water Mains and Sewers: Refer to Division 3 of these SPECIFICATIONS for applicable requirements. No water pipe shall pass through or come in contact with any part of a sewer system. Extreme caution should be exercised when locating water mains at or near certain sites such as sewage treatment plants or industrial complexes. Individual septic tanks must be located and avoided.
- 5.3.8 Surface Water Crossings: UTILITY shall review and approve the PLANS on a case-by-case basis. All aboveground pipes shall be painted as specified in Division 3 for water mains.
- 5.3.9 Air Release Valves: Within 500 feet of the water entry point from a well to the distribution system and at all high points in water mains where air can accumulate, provisions shall be made to remove the air by means of automatic air release valves. At a minimum, air release valves should be placed where there is a change of pipe grade of 2 foot or more and spacing shall at least be one air release valve every 1,500 feet. Automatic air release valves shall not be used in situations where flooding of the manhole or chamber may occur. See details in STANDARD DETAILS.
- 5.3.10 Chamber Drainage: Chambers, pits or manholes containing valves, blow-offs, meters, or other such appurtenances to a distribution system shall not be connected directly to any storm drain or sanitary sewer, nor shall blow-offs or air relief valves be connected directly to any sewer.
- 5.3.11 Disinfection Following Repair or Replacement: Any part of UTILITY water system which has direct contact with finished water and has been out of service for repair, alteration, or replacement shall be disinfected as outlined in Division 3 of these SPECIFICATIONS.

5.4 Water Services and Connections

- 5.4.1 Water services and connections shall conform to the applicable provisions of Division 3 and the STANDARD DETAILS. Only ¾", 1", 1-1/2", 2", 4", 6", 8" and 12" services will be allowed. Where water services greater than 12" are required, dual services shall be provided. Water services and connections to existing UTILITY systems up to 2" will be made by UTILITY. Services and connections to new water systems and to existing systems larger than 2" shall be made by the CONTRACTOR.

A UTILITY representative must be on site during any connections to existing UTILITY systems.

CONTRACTOR shall not provide water service to new systems/line extensions other than for flushing and testing until the NCDEQ has issued a "Letter of Final Approval." To comply with regulations, the new connection shall not be placed into service until the

"Letter of Final Approval" from NCDEQ has been obtained.

- 5.4.2 For multiple connections to UTILITY existing water systems, the CONTRACTOR shall make the final connection upon UTILITY receipt of the NCDEQ "Letter of Final Approval" in accordance with the applicable AWWA in accordance with the applicable AWWA standard for disinfection of new water systems/ line extensions.

5.5 Water Metering

- 5.5.1 **General:** All water service connections shall be metered and be directly in front of the property. In general, gang meters are not accepted. The method of metering shall follow the guidelines listed below. However, the DEVELOPER'S ENGINEER must obtain approval before finalizing the design of the metering system.
- 5.5.2 Single Family Duplex and Multi-Family Subdivisions with Public Rights-of-Way: Each unit shall be individually metered. Single and double services shall be installed at property lines as indicated by the STANDARD DETAILS.
- 5.5.3 Single Family and Duplex Subdivisions with Private Streets: Individual meters may be permitted in accordance with Division 2, Section 5.5.2 if the private streets are designed to the applicable county standards and easements are dedicated over the entire private street common areas. In addition, sufficient area must be available outside of paved areas to locate water mains, services, and meters. If the above criteria cannot be met, the subdivision shall be metered pursuant to Division 2, Section 5.5.5.
- 5.5.4 Commercial, Industrial and Institutional Projects without Private Standby Water Lines: In general, each building shall be individually metered. Meter(s) shall be located in the public rights-of-way at the property line. If this is not practical, then the meter shall be located no closer than 5' from the front of the building.
- 5.5.5 Commercial, Industrial, Institutional, Multi-Family with Private Streets, Apartments and Condominium Projects with Private Standby Water Lines: In general, all such projects shall require installation of a RPZ check assembly on each dedicated standby water line. Where on-site standby water systems contain less than 75 feet of main, a dual system (separate domestic and standby water lines) may be considered. Dual systems shall require backflow prevention in accordance with UTILITY Backflow Prevention Policy, latest edition. Individual meters to each unit are required.
- 5.5.6 Shopping Centers: In general, shopping centers shall require installation of a RPZ check assembly on each dedicated standby water line. Individual meters to each unit are required.
- 5.5.7 Meter Installation: All meters greater than or equal to 2" in size shall be provided by and installed by the CONTRACTOR. Meters less than two inches in size will be installed by UTILITY after payment of applicable fees and charges. All meters less than two inches in size will be installed underground in an approved meter box. Meters two inch and larger shall be installed by the CONTRACTOR per UTILITY Comprehensive Meter Program and the STANDARD DETAILS. In general, meters larger than two inch shall be located in a meter easement located adjacent to the public right-of-way.
- 5.5.8 Meter Sizing: Size of all meters shall be approved by UTILITY. The DEVELOPER'S

ENGINEER shall provide sufficient information on estimated peak flows and low flows. The developer's ENGINEER shall include head losses through metering devices when designing the water system.

5.5.9 Irrigation Meters: During the installation of the water system for a new development, UTILITY will require one (1) 1-inch service line to be installed between the water main and each lot. In the event that the builder and/or homeowner chooses to install an in-ground irrigation system, the 1-inch line can be retrofitted to include a 1" x 3/4" tee to accommodate both a 3/4" domestic meter and 3/4" irrigation meter.

5.5.9.1 A Reduced Pressure Zone (RPZ) backflow prevention device shall be installed behind the irrigation meter. The RPZ shall be one of the following models. With UTILITY permission, another manufacturer with equal specifications and workmanship may be used.

- Cla-Val – RP2
- Conbraco - 400
- Febco – 825Y (D)
- Watts – Series 009QT
- Wilkins – WK 975XL-075

5.5.9.2 Before installing an in-ground irrigation system, reference the “AQUA NORTH CAROLINA RESIDENTIAL IRRIGATION METER INSTALLATION” guidelines.

5.6 **Material, Installation and Testing**

Applicable provisions of Division 3 and Division 4 shall apply.

5.6.1 Meter Boxes

Meter Boxes for up to 1-inch meters will be NDS D1200 Standard Water Meter Boxes and lids. Alternatives only allowed if approved by the Utility Engineer in writing. The meter Box Body at a minimum will be tapered and have a minimum wall thickness of 0.25 inch, have a double wall at the top cover seat area with a minimum thickness of 0.187 inch. The cover seat area shall have 30 structural support ribs on the underside of the seat, each with a minimum thickness of 3/16 inch. The bottom body shall have a 1.0-inch flange. The meter box cover shall have a minimum thickness of 0.25 inch. Boxes and lids shall be injection molded of structural foam polypropylene with a melt index of 10-12. Meter Box Covers (lid) will be a drop-in type lid with a 2.0-inch remote reading hole port and a cast iron reader flap. Meter box and lids shall be manufactured by the same manufacturer and designed to fit as a unit.

Placement of any meter within traffic loading areas or pavement areas is not preferred. If such an installation is proposed, it must be approved by the Utility Engineer in writing.

Meters and Meter Boxes/vaults larger than 1.0-inch will be approved on a case by case basis by the utility Engineer.

5.7 Location and Identification

A means for locating and identifying all water mains and valves shall be provided in accordance with Division 3 and the STANDARD DETAILS.

5.8 Cross-Connection Control

5.8.1 Location and Installation: In general, all backflow prevention assemblies shall be located directly following the water meter on developer/owner's property. If no meter is present (such as a building dedicated fire line) the backflow device shall be located that the right-of-way, edge of easement or edge of property line, and Aqua shall have no responsibility for the installation, operation or maintenance of the backflow device. Backflow prevention assemblies shall be installed aboveground to facilitate maintenance and testing and shall be operated with appropriate heat tracing for freeze protection. UTILITY's Cross Connection Control Policy shall be followed. It shall be the developer/owner's responsibility to purchase, install and maintain all backflow prevention assemblies. All cross-connection controls shall be tested and inspected by a North Carolina Department of Environmental Quality (NCDEQ) certified backflow prevention tester in accordance with state rules and regulations prior to acceptance by Aqua. Testable backflow devices shall be tested in accordance with State, Federal, and Local laws on a prescribed frequency but at a minimum of annually by a certified backflow prevention tester. Results from these tests shall be provided to Aqua NC. Any devices that are found to be defective shall be repaired immediately and follow-up test results provided to the UTILITY. Testing and maintenance of the backflow devices shall be the sole responsibility of the property owner. Failure to submit testing results and/or maintaining the devices in proper operational order could result in enforcement up to severance of service.

DIVISION 3

CONSTRUCTION SPECIFICATIONS

General Construction Requirements

Division 3

Section 1

General

1.1 Grades, Survey Lines, and Protection of Monuments

- 1.1.1 Grade: Benchmarks and base line controlling points shall be established prior to beginning work. Reference marks for lines and grades as the work progresses will be located so as to cause as little inconvenience to the prosecution of the work as possible. The CONTRACTOR shall place excavation and other materials as to cause no inconvenience in the use of the reference marks provided. CONTRACTOR shall remove any obstructions placed contrary to this provision.
- 1.1.2 Surveys: The CONTRACTOR shall furnish and maintain, at his own expense, stakes and other such materials, and give such assistance, including qualified helpers, for setting reference marks to the satisfaction of UTILITY and the ENGINEER. The CONTRACTOR shall check such reference marks by such means as he may deem necessary and, before using this, shall call UTILITY's attention to any inaccuracies. The CONTRACTOR shall, at his own expense, establish all working or construction lines and grades as required from the reference marks, and shall be solely responsible for the accuracy thereof. The CONTRACTOR shall, however, be subject to the check and review of UTILITY.
- 1.1.3 Monument Preservation: Property comers and survey monuments shall be preserved using care not to disturb or destroy them. If a property comer or survey monument is disturbed or destroyed during construction, whether by accident, careless work, or required to be disturbed or destroyed by the construction work, said property comer or survey monument shall be restored by a land surveyor registered in the State of North Carolina. All costs for this work shall be paid for by the CONTRACTOR.

1.2 Utility Coordination

- 1.2.1 Location of Utilities: Prior to proceeding with trench excavation the CONTRACTOR shall contact all utility companies in the area to aid in locating their underground services. It shall be the contractor's responsibility to contact utility companies at least three (3) normal working days before starting construction. The CONTRACTOR shall proceed with caution in the excavation and preparation of the trench so that the exact location of underground utilities may be determined.

The CONTRACTOR shall take all reasonable precautions against damage to existing utilities. However, in the event of a break in an existing water main, gas main, sewer or underground cable, the CONTRACTOR shall immediately notify the responsible official of the organization operating the interrupted utility. The CONTRACTOR shall lend all possible assistance in restoring services and shall assume all cost, charges, or claims

connected with the interruption and repair of such services.

- 1.2.2 Deviations Occasioned by Structures or Utilities: Wherever obstructions are encountered during the progress of the WORK and interfere to such an extent that an alteration in the PLANS is required, the ENGINEER shall have the authority to order a deviation from the line and grade and the UTILITY shall have final approval authority. If a change in line or grade of a gravity sewer is necessary, UTILITY will require the addition of any manholes needed to maintain the integrity of the sewer system.
- 1.2.3 Test Pits: Test pits for the purpose of locating underground pipeline, utilities, or structures in advance of the construction shall be excavated and backfilled by the CONTRACTOR. Test pits shall be backfilled immediately after their purpose has been satisfied and maintained in a manner satisfactory to the applicable county and UTILITY. The costs for such test pits shall be borne by the CONTRACTOR.
- 1.2.4 Protection of Existing Facilities: Temporary support, adequate protection and maintenance of all underground and surface utility structures including sewers, manholes, hydrants, valves, valve covers, and miscellaneous other utility structures encountered in the progress of the WORK shall be furnished by the CONTRACTOR at his expense. Any such structures which may have been disturbed shall be restored upon completion of the WORK.

1.3 Construction in Easements and Rights-of-Way

- 1.3.1 Construction in Easements: In easements across private property, the CONTRACTOR shall confine all operations within the easement area and shall be responsible and liable for all damage outside of the easement area. Trees, fences, shrubbery or other type of surface improvements located in easements will require protection during construction. Precautions shall be taken by adequate sheeting or other approved method to prevent any cave-in or subsidence beyond the easement limits or damage to improvements within the easement. In general, the easement area is intended to provide reasonable access and working area for efficient operation by the CONTRACTOR. Where easement space for efficient operation is not provided, the CONTRACTOR shall be responsible for organizing his operations to perform within the restrictions shown on the PLANS.
- 1.3.2 Construction in NCDOT Right-of-Way: The CONTRACTOR shall conform to all requirements of the NCDOT where construction work is in a right-of-way under the jurisdiction of the State of North Carolina. CONTRACTOR is required to have a copy of the encroachment agreement on the site at all times.
- 1.3.3 Construction in County Right-of-Way: WORK shall be governed by the applicable county right-of-way utilization regulations.

1.4 Suspension of Work due to Weather

During inclement weather, all WORK which might be damaged or rendered inferior by such weather conditions shall be suspended. During suspension of the WORK from any cause, the WORK shall be suitably covered and protected so as to preserve it from injury by the weather or otherwise.

1.5 Cooperation with other Contractors and Forces

During construction progress, it may be necessary for persons employed by UTILITY to work in or about the site. UTILITY reserves the right to access to the construction site at such times as UTILITY deems proper. The CONTRACTOR shall not impede or interfere with and shall cooperate with UTILITY for proper execution of the WORK.

1.6 Subsurface Exploration

The CONTRACTOR shall conduct subsurface explorations as necessary to perform the WORK.

1.7 Salvage

Any existing UTILITY owned equipment or material including but not limited to pumps, motors, control panels, valves, pipes, fittings, couplings, etc. which are removed or replaced as a result of construction shall be designated as salvage by UTILITY. If considered as salvage, the material shall be carefully excavated if necessary and delivered to UTILITY at a location designated by UTILITY.

1.8 Shop Drawings and Samples

The CONTRACTOR shall submit one (1) hard copy and one electronic copy (PDF) of the shop drawings, signed by the DEVELOPER'S ENGINEER, to UTILITY for approval. The data shown on the shop drawings shall be complete with respect to dimensions, design criteria, materials of construction and the like to enable review of the information as required.

The CONTRACTOR shall, if requested by UTILITY, furnish certificates, affidavits of compliance, test reports, or samples for check analysis for any of the materials specified in this MANUAL.

1.9 Refurbished Materials

All materials for construction shall be new materials. Any refurbished materials shall be allowed at the judgment and upon approval of the UTILITY Construction Coordinator.

Division 3

Section 2

Well Site Preparation

2.1 General

This Section covers the clearing, grubbing, stripping, grading, and any other work needed to prepare the construction site. The CONTRACTOR shall clear and grub all of the areas within the limits of construction as shown on the PLANS and approved by the COUNTY prior to the beginning of any WORK. All site work shall conform to the applicable site clearing, landscaping and tree ordinances of the applicable COUNTY or local governing jurisdiction.

2.2 Clearing and Grubbing

2.2.1 Clearing: The surface of the ground for the area to be cleared and grubbed shall be completely cleared of all timber, brush, stumps, roots, grass, weeds, rubbish and all other objectionable obstructions resting on or protruding through the surface of the ground. Protect trees, shrubs, vegetative growth and fencing which are not called out for removal. Clearing operations shall be conducted so as to prevent damage to existing structures, installations and to those under construction, so as to provide for the safety of employees and others.

2.2.2 Grubbing: Grubbing shall consist of the complete removal of all stumps, roots larger than 1-1/2 inches in diameter, matted roots, brush, timber, logs and any other organic or metallic debris not suitable for foundation purposes, resting on, under or protruding through the surface of the ground. All depressions excavated below the original ground surface for or by the removal of such objects shall be refilled with suitable materials and compacted to a density conforming to the surrounding ground surface.

2.2.3 Stripping: In areas so designated, top soil shall be stripped and stockpiled. Topsoil stockpiled shall be protected and seeded to protect from erosion until it is placed as specified. Any topsoil remaining after all WORK is in place shall be disposed of by the CONTRACTOR unless directed otherwise by UTILITY.

2.3 Grading

2.3.1 Access & Site Grading

- A. Well site shall be sufficiently graded to allow access and set up of drilling equipment.
- B. Additional grading may be required for well testing equipment.

2.3.2 Finished Grading

- A. Well site shall be graded so that finished ground level of the well is at least 12" above the surrounding area within a 30' radius to ensure that surface water drains away from the well in all directions. A minimum of 20' of this radius shall be level within 3" for the construction of the house. No water shall be allowed to collect at any point within the 100' radius. The entire site shall be graded to provide for positive drainage away from the wellhead and so any storm water that enters the 100' radius shall drain to points outside the radius.
- B. Only clean fill dirt shall be used to fill well sites. Fill dirt shall be compressed and compacted every 18" of fill. If UTILITY's Representative is not satisfied with the compaction and the compaction is not sufficient to support the facility and storage tank, compaction tests may be required to be done by a qualified agency. If it is found that the site is not compacted properly, the CONTRACTOR shall pay to correct the problem.
- C. No potential sources of contamination including fertilizers, chemical or petroleum substances shall be placed within the 100' radius of the well head.
- D. All pushed up shrubs, trees, etc, shall be removed from well site during excavation and prior to the finish grading. No burying of shrubs & trees shall be acceptable. In addition, no dumping shall be allowed on to the well site.
- E. Prior to acceptance by Utility, the Owner shall be responsible for removal of all debris or non-permitted substances on well lot.
- F. Final grading of the well site shall be smooth and ready for grassing and/or graveling.

2.4 Grassing

2.4.1 Well site shall be grassed.

2.4.2 Grassing:

2.4.2.1 Grass seed shall be applied evenly. Hydroseeding is permitted so long as no unapproved materials are used (see 2.3.2.2, below). Refer to the materials list for approved grass types.

2.4.2.2 Straw shall be applied over grass seed. Jute or coconut matting will be required for steeper slopes as needed and in areas where excessive erosion is noted. No fertilizers, chemicals or petroleum products shall be placed on the well site.

2.4.2.3 The contractor shall ensure a good stand of grass

2.4.3

2.5 Roads

PLEASE NOTE: References to access roads, turn arounds, widths of roads and road construction with these specifications and associated documents are Aqua NC's minimum standard. Other Agencies such as

the Fire Service, EMS, and Sherriff's Departments may have more stringent/conservative requirements. An example would be the North Carolina Fire Code – Appendix D “Fire Apparatus Access Roads”. It is the responsibility of the Engineer and Construction Contractor to coordinate design/construction of these access roads/turn arounds with the local Fire Marshal. Design and Construction will meet all requirements – Aqua NC and other agencies.

- 2.5.1 There shall be an all-weather access road of at least 10' in width constructed within the recorded 20' easement to each well site with a 15'x25' turn around area of at the well adequate to accommodate complete turnaround of service vehicles, unless otherwise specified by local ordinances.
- 2.5.2 Access roads shall be graded with a minimum of 6" center crown in the road. If determined by the Inspector, side ditches to allow water to run off will also be required. At UTILITY Representative's discretion, rip rap may also be required on steep inclines.
 - 2.5.2.1 All drainage ditched shall be lined with excelsior rolled erosion product to protect from erosion.
- 2.5.3 Road and side ditches shall be so constructed as to not direct or allow water runoff to drain toward the wellhead.
- 2.5.4 The finished access road shall be adequately compacted and covered with at least 6" of crush and run gravel and extend from the street to the doors of the facility (including turn around area) and the slab surrounding the wellhead.
- 2.5.5 Culvert pipe shall be placed in all low areas of access road and sized to handle flow of 50-year flood.
- 2.5.6 Road shall be designed and constructed to allow access of large equipment and allow re-drilling of the well, if necessary.
- 2.5.7 Road shall not exceed 12% grade without written consent of UTILITY.
- 2.5.8 A controlled access acceptable to the UTILITY shall be provided at each well site and shall consist of a post and cable properly marked, a gate, or mallard. UTILITY's Representative shall determine which method shall be acceptable.
- 2.5.9 Graveling:
 - 2.5.9.1 Well drive and turn around shall be graveled. The gravel shall be placed so as not to direct water towards the well and also not to block the access to the facility.
 - 2.5.9.2 Gravel shall be 3/4" or smaller crush and run and shall be applied at least 6" thick. Alternatives may be considered (such as #57 or #67 stone or asphalt paving if approved by UTILITY) based on what is deemed suitable to the

neighborhood and acceptable to the UTILITY.

- 2.5.9.3 Graveled areas shall include geotextile between gravel layer and compacted earth surface. Geotextile shall be designed for drainage and separation. Geotextile shall have a minimum grab tensile strength of 120 lbs or greater.

Division 3

Section 3

Wells

3.1 Grading

3.1.1 Access & Site Grading

3.1.1.1 Well site shall be sufficiently graded to allow access and set up of drilling equipment.

3.1.1.2 Additional grading may be required for well testing equipment.

3.2 General

3.2.1 An on-site meeting with a UTILITY Representative shall be held prior to drilling a well. UTILITY must be notified a 1 week in advance prior to beginning drilling, setting the casing and beginning grouting.

3.2.2 Well shall be drilled at the specified well stake put in the ground by the surveyor, as approved by NCDENR, and in accordance with these specifications (see Section 1).

3.2.2.1 If the well is not drilled in staked location designated by the surveyor or does not have a minimum 100' radius approved by the State, the UTILITY shall not accept the well.

3.2.3 The well drilling contractor and/or DEVELOPER shall obtain any and all required permits needed to drill a well. Penalties assessed for not obtaining the required permits shall be the sole responsibility of the CONTRACTOR and/or DEVELOPER. UTILITY shall not be liable if the required permits are not obtained.

3.2.4 Well Diameter

3.2.4.1 Rock Wells: All rock wells shall be drilled with a minimum 8" well casing . UTILITY requires that the well hole from the bottom of the casing be drilled with a minimum 8" diameter for the full length of the well unless otherwise specified by the UTILITY. Exceptions must be approved by the Utility in writing.

3.2.4.2 Sand Wells: All sand wells shall be drilled with a minimum 8" well casing unless otherwise specified by the UTILITY.

3.2.5 Only potable water shall be used in the process of well drilling. Tanks and vessels carrying water for drilling purposes must be chlorinated to a minimum 50 parts per

million each time they are filled. All chlorine products must be free of sun inhibitors or sun stabilizers. Water from sources, such as unapproved wells, lakes, ponds, rivers, streams, etc, shall not be used.

- 3.2.6 All other drilling fluids and additives used shall comply with recognized industry standards and practices and be applied and used as prescribed by the manufacturer. Toxic and/or unapproved substances shall not be added to drilling fluid.
- 3.2.7 Wells shall be drilled straight and plumb the entire depth of the well. Crooked wells will not be accepted. If Aqua determines the wells is not plumb, i.e unable to install a temporary pump or permanent pump, Aqua will require a new well to be drilled at others expense
 - 3.2.7.1 Rock Wells: The well driller shall attempt to drill to a depth at least fifty (50) feet beyond the last water-bearing fracture.
 - 3.2.7.2 Sand Wells: Casing shall extend at least one (1) foot into the top of the water-bearing formation and in no case be less than 55 feet below ground level.
- 3.2.8 The well shall be constructed in accordance with all State and County regulations, AWWA standards and UTILITY specifications.
- 3.2.9 The well shall be thoroughly cleaned of all drill cuttings prior to the removal of the drilling equipment.
- 3.2.10 At the completion of drilling, the well drilling contractor shall chlorinate the well with granular and tablet chlorine such as HTH or equivalent to a tested level of 100 ppm for 24-hours in accordance with AWWA rule C654 and section .1002 of *The Rules Governing Public Water Supply Systems* (NCAC Title 15A, Subchapter 18C, Section 1002). All chlorine products must be free of sun inhibitors or sun stabilizers.
- 3.2.11 A signed and complete copy of the State and/or County required well drilling record/log shall be submitted to UTILITY showing the name of the Subdivision, well number, coordinates of well, well drilling company, date drilled, depth of well, depth of casing, drive shoe, depth of the grouting and placement method used, static water level, depth and yield at each water zone (including those zones cut off by the installation of the casing), total yield, etc. Well records without the above data will not be accepted.

3.3 Well Casing

- 3.3.1 Drive shoe (Rock Wells only) - A drive shoe must be installed on the end of casing. The drive shoe shall be made of forged, high carbon, tempered seamless steel and shall have a beveled, hardened cutting edge. This shoe shall be firmly driven into the rock at least 5' into competent bedrock to make a seal with 10' being preferred. **This should be documented on the signed well construction report.**
- 3.3.2 Casing material - New casing which bears mill markings and which conforms to standard specifications – carbon steel or approved equivalent for water well pipe shall be used. Casing shall be 8" inch heavy weight (0.322" wall thickness), carbon steel or ASTM F480 galvanized or approved equivalent for water well pipe unless otherwise specified. Thermoplastic casing will not be accepted on rock wells.

- 3.3.3 Casing length (Rock Wells only) - Where firm bedrock is encountered shallower than 55 feet, a minimum casing length of 55 feet below ground level will be required. Unless otherwise specified by the on-site Utility Representative, the well must be drilled a minimum of 5' into competent bedrock where the drive shoe and casing must be secured.
- 3.3.4 Method of joining - Casing lengths shall be joined in alignment and water tight by a method appropriate to the material used so that the resulting joint shall have the same structural integrity and protection as the casing itself. Threaded and coupled joints shall be API or equivalent and made up tight. Welding is acceptable.
- 3.3.5 Sanitary protection of the well - The well site shall be protected at all times during the drilling. The casing shall be sealed with a suitable flanged, threaded, welded cap, or compression seal upon completion. The top of the outside casing shall extend at least 12" above concrete finished floor level/elevation.
- 3.3.6 There shall be no openings in the casing wall below its top except for water level measurement access ports, vents, or grout nipples. Such openings shall be sealed water tight prior to leaving the well site.
- 3.3.7 An identification plate shall be attached to each public well immediately after drilling is completed. The well drilling contractor shall furnish a completed well identification plate as outlined below prior to leaving the job site. The well will not be accepted without this tag.
- 3.3.7.1 The identification plate shall be constructed of a durable, weatherproof, rustproof metal or equivalent material.
- 3.3.7.2 The identification plate shall be securely attached to the well casing where it is readily visible.
- 3.3.7.3 The identification plate shall be stamped with permanent markings to show the following information:
- Drilling contractor and registration number.
 - Date well completed.
 - Total depth of well.
 - Casing: Depth (feet), Inside Diameter (inches).
 - Yield or specific capacity expressed in gallons per minute (gpm), or gallons per minute per foot of draw down (gpm/ft.dd).
 - Static water level and date measured.
 - Gravel and screen size (if applicable).

3.4 Well Grouting

- 3.4.1 Grouting materials - For all community wells, composition of grout must meet State requirements.
- 3.4.2 The entire length of the well casing shall be grouted completely before the driller leaves

the site, i.e., in one pour.

- 3.4.3 The UTILITY may specify pressure grouting a well from the inside of the end of the casing out into the annular space; however tremie grouting is the preferred method. Or the UTILITY may specify grouting to the end of the casing within the annular space using two tremie pipes to ensure good distribution around the casing.
 - 3.4.3.1 (Rock Wells only) Contractor shall not pour concrete. Well shall be grouted using the following method: grouting to the end of the casing within the annular space using tremie pipes to ensure good distribution around the casing, or pressure grouting.
- 3.4.4 Below are the specifications for using these types of grouting methods.
 - 3.4.4.1 Grout material shall be placed by tremie pumped or forced injection after water or other drilling fluid has been circulated in the annular space sufficiently to clear all obstructions including rock chips in Type I wells.
 - 3.4.4.2 In accordance with State regulations, there must be a minimum annular space equal to either one-third of the outside diameter of the casing or at a minimum two inches.
 - 3.4.4.3 When emplacing the grouting material, the tremie pipe shall be lowered to the bottom of the zone to be grouted and raised slowly as the grout material is introduced.
 - 3.4.4.4 The tremie pipe shall be kept full continuously from start to finish of the grouting procedure, with the discharge end of the tremie pipe being continuously submerged in the grout until the zone to be grouted is completely filled.
 - 3.4.4.5 The grout must be allowed to properly cure at least 24 hours before construction may be resumed.
- 3.4.7 (Rock Wells only) For sanitary protection, the well should be grouted from the bottom of the casing secured in firm bedrock. Special care must be taken to set casing and grout into Piedmont crystalline rock and not just too overlying isolated boulders or iron hardpan. Additional length of grout may be necessary in some cases to support the weight of the casing.

3.5 Well Screens (Sand Wells only)

- 3.5.1 The well shall be equipped with a screen that will adequately prevent the entrance of formation material into the well after the well has been developed and completed by the well contractor.
- 3.5.2 The well screen will be of a design to permit the optimum development of the aquifer with minimum head loss consistent with the intended use of the well. The openings shall be designed to prevent clogging and shall be free of rough edges, irregularities or other defects that may accelerate or contribute to corrosion or clogging. How this design is determined shall be included with the Engineer's submittal for approval. (i.e. were samples sent to the screen manufacturer to determine optimum screen size, etc.)

3.5.3 Multi-screen wells shall not connect aquifers or zones which have differences in water quality with would result in contamination of any aquifer or zone.

3.5.4 Under no circumstances will a well screen be set less than 55 feet below land surface.

3.6 Gravel and Sand Packed Wells (Sand Wells only)

3.6.1 In constructing a gravel or sand packed well:

3.6.1.1 The packing material shall be composed of quartz, granite, or similar rock material and shall be clean, of uniform size, water-washed and free from clay, silt, or other deleterious material.

3.6.1.2 The size of the packing material shall be determined from a grain size and of the formation material and shall be of a size sufficient to prohibit entrance of formation material into the well in concentrations above five (5) milliliters per liter of settleable solids and ten NTU's of turbidity as suspended solids as permitted under N.C.2C Rules.

3.6.1.3 The packing material shall be placed in the annular space around the screens casing by a fluid circulation method, preferable through a conductor pipe to insure accurate placement and avoid bridging.

3.6.1.4 The packing material shall be adequately disinfected.

3.6.1.5 Centering guides must be installed within five (5) feet of the top packing material to ensure even distribution of the packing material in the borehole.

3.6.2 The packing material shall not connect aquifers or zones which have differences in water quality that would result in deterioration of the water quality in any aquifer or zone.

3.7 Well Development

3.7.1 All water supply wells shall be properly developed by the well driller;

3.7.2 Development shall include removal of formation materials, mud, drilling fluids and additives such that the water contains no more than:

3.7.2.1 five (5) milliliters per liter of settleable solids; and

3.7.2.2 ten (10) NTUs of turbidity as suspended solids.

3.8 Testing

3.8.1 No well shall be accepted when the drawdown test results are less than 15 gallons per minute unless accepted and approved by the Utility in Writing. .

3.8.2 A UTILITY Representative shall be present at start and completion of the drawdown. UTILITY must be provided 1 week notice prior to start of drawdown testing.

- 3.8.3 Test pump shall be set at the depth specified by UTILITY and shall be of sufficient size to determine the true well yield.
- 3.8.4 Perform a step test at a maximum of one hour, minimum of thirty minutes, or between as the production stabilizes (Step test with a minimum steps of 30 to 60 minutes). The steps should be performed in the following order: 50% production, 75% production, 100% production, and 125% production. The water level should be checked every one (1) minute and will be considered stable after ten (10) stable representative reads. If the production stabilizes quickly at 125% a similar test should be performed at 150% production.

Water level measurements shall be collected by hand or by acoustic monitoring.

- 3.8.5 A 24-hour test with a two-hour recovery shall be run without interruption. If the test is interrupted for any reason, it shall be the contractor's responsibility to re-run a complete test at no extra charge to the owner. Wells that have not been placed in service within two years of the date the well was drilled will require a current 24-hour well drawdown test to be completed.
- 3.8.6 Wells in close proximity to other community wells and/or private wells will be required to be tested simultaneously in accordance with State and Local Regulations.

- 3.8.7 This test shall be run in accordance to UTILITY's specifications, which are as follows:

3.8.7.1 GPM and Pumping Level –

- Check every 5 minutes for 1st hour
- Check every 10 minutes for 2nd hour
- Check every 15 minutes for 3rd hour
- Check every 30 minutes for 4th hour
- Check every hour for remainder of test

3.8.7.2 Field Water Quality Parameters - Field water quality parameters (iron, manganese, hardness and pH) shall be tested as follows:

- 1st hour then,
 - Every 4 hours thereafter, then,
 - At the end of the test
 - Field samples should be pulled more often if parameters are not within limits.
- *The drawdown/capacity test will NOT be accepted unless the field water quality parameters are collected and the results recorded on the 24 hour drawdown report**

3.8.7.3 New well analysis samples shall be collected between the 10th to 12th hour of the 24 hour draw-down test.

3.8.7.4 After the 24-hour test is run, shut off the pump and start the recovery test as stated below.

3.8.7.5 Recovery Static Level -

- Check every 1 minute for 1st 30 minutes

- Check every 10 minutes for 2nd 30 minutes
 - Check every 15 minutes for 3rd 30 minutes
 - Check every 30 minutes for 4th 30 minutes
- 3.8.8 Water sample results must meet all regulatory and/or UTILITY water quality standards. The following contaminants will be sampled from every new well: bacteriological, inorganic chemical, including gross alpha and beta particles, uranium, radium 226 and 228, volatile organic chemicals, synthetic organic chemicals, Asbestos (as applicable), and any other regulated or unregulated contaminants as deemed necessary by the UTILITY. At least one copy of these analyses shall be submitted to UTILITY.
- 3.8.9 After the test pump is removed, the contractor shall rechlorinate the well to at least 100 ppm for 24-hours as required by AWWA rule C654 and recap it.
- 3.8.10 At least one signed hard copy and one electronic (PDF) copy of the well drawdown test shall be submitted to UTILITY.
- 3.8.11 Test log shall include gallons per minute, static water level, pumping water level, above ground head, time, turbidity of water, depth of any noted cascading of water, and all field parameter testing results.
- 3.8.12 A videotape shall be made of the well and a copy presented to the UTILITY. Should the video indicate that well construction deficiencies exist, the owner of the well shall be responsible for all necessary construction modifications. Any additional drawdown tests or any water analyses required due to construction modifications will be at the well owner's expense.
- 3.8.13 The Available Yield of the well shall be considered to be 90 percent of the 24-hour draw down stabilized pumping rate. If the specific capacity of the well is greater than 1, then 100% of the pumping rate may be used. The 1 gallon per minute per connection will be based on the Available Yield of 90%. Unused Capacity available shall not exceed the 90% threshold and is subject to a new pump test at the time of the new request and at each request thereafter.
- 3.8.14 Resampling: When at the discretion of the UTILITY, sufficient cause exists to resample water quality parameters, then a modified draw down test shall be run for, at least 3 volumes of the well or for the length of time as determined by the UTILITY, at the stabilized draw down pumping rate. The water quality samples for laboratory analyses shall be drawn at the end of the modified draw down test. If field parameter testing during the original draw down test indicated significant changes in water quality during the 24-hour test, then the resampling draw down test will run through the time of the changing concentrations, but no less than 3 hours. During the modified draw down testing, all field parameters shall be sampled at the above frequencies.
- 3.8.15 When well modifications are made to significantly alter the hydrologic or water quality conditions (i.e. a packer, liner, or concrete fill), or the well has not been activated within 2 years, then a complete draw down test shall be conducted on the modified well. Water samples to be pulled at the end of the test to determine the new sample results.

3.9 Well Abandonment

- 3.9.1 In the event that a well is not accepted by the Utility, it shall be abandoned in accordance with the North Carolina Administrative Code, Subchapter 2c, Section .0113 and Section .0114 and in accordance with County rules and regulations. A representative of the UTILITY shall be notified of the well abandonment 24-hours prior to completing the abandonment for Inspection purposes.
- 3.9.2 An official Well Abandonment Record on latest official form provided by the Division of Water Quality (Groundwater Section) shall be completed. A copy of this completed form shall be sent to the County Health Department, NCDENR, and UTILITY.
- 3.9.3 **All unused wells must be abandoned to protect the integrity of the ground water supply.** It shall be at the discretion of the UTILITY to allow a well not being used for the community water system to be kept for irrigation or other purposes.

Division 3

Section 4

Plumbing

4.1 Valve Bank

- 4.1.1 A valve bank shall be installed and sized in accordance with the approved plans and UTILITY's specifications. The valve bank shall be designed so that the maximum water velocity shall be 8 ft/sec. All Valves with be clock-wise closed and counter clock-wise open. All water valves within the Well House (whether main well house or satellite) shall be ¼ turn ball valves.
- 4.1.2 Only ASTM approved pipe shall be used above ground level as specified on the parts list.
- 4.1.3 Acceptable piping for below ground installations can be found on the materials list.
- 4.1.4 A turbine meter shall be installed on wells yielding more than 30 gpm water production. The turbine meter shall be capable of producing a 4-20 ma signal and shall also have a visual indicator showing the gallons per minute and total gallons pumped. Said meter size and model shall be specified by UTILITY.
- 4.1.5 A positive displacement meter of 1" size shall be used on wells producing 30 gpm or less. The meter shall be capable of producing a 4-20 ma signal and shall also have visual indicator showing the gallons per minute and total gallons pumped
- 4.1.6 Each valve bank shall have a WYE strainer installed before the water enters the meter. The WYE strainer shall be equipped with a ball valve and be piped to discharge at least 40 feet from the building to a ditch or the lowest point on the well lot. This drain shall not be installed in such a manner to cause flooding or standing water on the well lot. An air gap shall be maintained at the discharge end of the pipe. A rodent screen and splash block shall also be provided at the discharge end of this pipe.
- 4.1.7 When the plumbing is complete, all inside pipes 1" or smaller shall be insulated with rubber tube insulation such as Rubatex. All outside pipes and appurtenances shall be heat traced and insulated with rubber insulating tape such as Rubatex tape to a minimum thickness of 7/8" and covered with PVC pipe sized as follows:
- 2" or Smaller Pipe - 2" Rubatex & 4" Sch. 40 PVC
 - 4" or Smaller Pipe - 4" Rubatex & 6" Sch. 40 PVC
- 4.1.8 A ¼ inch ball valve with WOG rating of 600 psi shall be installed on all gauges.
- 4.1.9 Gauges of proper pressure rating as determined by UTILITY shall be oil filled.

- 4.1.10 Swing check valves, spring check valves, ball valves, and short stem gate valves shall meet a minimum of 200% of the operating systems pressure or the ASTM approved rating, whichever is greater.
- 4.1.11 A pressure switch shall be installed complete with 1/4" shut off, 1/4" drain and oil-filled gauge of the proper pressure.
- 4.1.12 One threaded hose bib equipped with a vacuum breaker shall be installed in the chemical feed equipment. An unthreaded sample tap shall be provided at the well head. One unthreaded sample tap shall be provided on the system side of the valve bank.
- 4.1.13 All blow off pipes shall be installed so that the water will drain to a ditch or the lowest area of the well lot. This drain shall not be installed in such a manner as to cause flooding or standing water on the well lot. An air gap and rodent screen shall be maintained at the discharge end of the pipe.
- 4.1.14 In compliance with *OSHA 29 CFR 1910.151(c), emergency dual head eye wash units piped to the valve bank on the system side of the check valve will be located within the well house near the chemical equipment and near the entrance to the building. Drench hoses shall remain in operable condition at all times. The emergency eye wash heads will be located between 4 and 5 feet above the floor and attached to the wall per manufacturer specifications.
- 4.1.15 Coatings and Linings: Where ductile iron pipe and fittings are installed below grade or installed in a casing pipe, a bituminous coating approximately 1.0 mil thick shall be applied in accordance with ANSI/AWWA A21.51/C151. Where ductile iron pipe and fittings are to be installed aboveground, pipe, fittings and valves shall be thoroughly cleaned and given one field coat (minimum 1.5 mils dry thickness) of rust inhibitor primer. Intermediate and finished field coats of Alkyd shall also be applied by the CONTRACTOR (minimum 1.5 mils dry thickness each coat). Primer and field coats shall be compatible and shall be applied in accordance with the manufacturer's recommendations. Final field coat shall be olive green for raw water and dark blue for finished water.

All ductile iron pipe and fittings shall have an interior protective lining of cement-mortar with a seal coat of asphaltic material in accordance with ANSI/AWWA A21.4/C104

- 4.1.16 Distribution Pressure Relief Valve (PRV): On all systems containing hydropneumatic tanks as the storage and pressure regulating structure - A pressure relief valve shall be located within the well house and mounted on the piping such that it is exposed to the pressures as experienced by the distribution system. This PRV will be piped so that when activated it will discharge to the blow-off piping listed above.
The PRV shall be factory set at 100 pounds per square inch and shall be a 2 inch flow model as manufactured by Kunkle with the capability of discharging water in a range from 19 gallons per minute (gpm) to 229 gallons per minute. The PRV shall be built as follows:

All Bronze with Pressure tight cap
Both inlet and outlet connections will be cast integral with body to permit easy inspection and servicing without disconnecting piping.
Beveled seats lapped for optimum performance.

Stainless Steel (SS) spring for optimum corrosion resistance
Working pressure rated from 1 to 300 psig
Temperature rated from -60 to 406 degrees Fahrenheit

If the well pump or pumps within the system have an approved capacity to exceed 200 gpm, then multiple valves or larger valves must be evaluated. The discharge capacity of the valve(s) must meet the well pump(s) approved pumping capacity.

This valve will be installed behind a ¼ turn ball valve as shown in the details.

4.2 Hydropneumatic Tank

- 4.2.1 The contractor will plumb in the hydropneumatic tank, including but not limited to, the supply line, discharge line, air compressor piping, pressure relief, vacuum breakers, etc., (in accordance with the utility drawing.) and shall provide protection from freezing for these items.
- 4.2.2 The supply main will be of new ASTM approved pipe, complete with 90-degree ell, unions, etc. Where the tank is set on prefab saddles, a mechanical joint dresser coupling shall be provided ahead of tank connection to allow for settling.
- 4.2.3 One Well System - A 2" blow-off assembly complete with square nut cast valve and a cut off valve between the blow-off assembly and the tank shall be installed. A 2" galvanized or brass coupling shall be left within 3" of the top of the blow-off valve box for future connections (in accordance with the Utility drawing).
- 4.2.4 Multiple Tank Systems - A tank bypass of the proper size shall be installed on systems with more than one hydro-pneumatic tank and on potential elevated tank systems with hydro-pneumatic tank, complete with tank and main cutoff valves (in accordance with the Utility drawing).
- 4.2.5 The relief valve shall be a side discharge of pressure rating and size as per UTILITY specifications and shall be mounted on the top of the tank and will insulated to prevent freezing.
- 4.2.6 The vacuum breaker shall be a minimum 3/4" installed as shown in accordance to the utility drawing.
- 4.2.7 A ball valve with 600 WOG rating and a ball valve with a locking device shall be installed between the tank and the pressure relief valve and vacuum breaker (in accordance with the Utility drawing).

4.3 Air Compressor

- 4.3.1 An air compressor shall be installed complete with necessary piping and fittings.
- 4.3.2 Air compressor shall be of sufficient pressure to overcome the system cut-off pressure

while providing a minimum of .5cfm of free air. Controls shall be provided to start and stop the compressor due to water levels and pressures.

- 4.3.3 Probes used for air compressors shall be set at 6" above the center of the hydro-pneumatic tank. The air compressor safety cut off shall be set 2 psi above the system cut off pressure.
- 4.3.4 When used, the air volume control shall be placed so as to maximize the drawdown of the hydro-pneumatic tank during cycles.
- 4.3.5 All pipe in conjunction with air compressor shall be thoroughly cleaned to remove any cuttings or oil that might be left from cutting and threading of pipe.

4.4 Ground Storage Tanks

- 4.4.1 Inlet and outlet fittings shall be located, sized, and of the type specified by the UTILITY and designed to promote turnover in the tank.

4.5 Distribution

- 4.5.1 The distribution line shall be C900 DR 14 PVC or ductile iron as specified by the UTILITY, complete with mechanical joint fittings, ductile iron spools (inc. attached to the bottom flange of the tank), flange adapter, reducers, etc. A locating wire 30 mil HDPE jacket or larger, shall be attached to the locating wire left by the distribution system contractor and run with the pipe, the end terminating at the top of the valve box or under the tank. All underground pipes shall have a minimum cover of 3' with the first 18" of fill free of rocks and debris. Concrete blocking or approved restraint fittings shall be provided behind all ells and tees as per AWWA standards (in accordance with the utility drawing.)

Division 3

Section 5

Storage Tanks

5.1 Hydropneumatic Storage Tanks

- 5.1.1 Hydropneumatic tank shall be constructed and stamped in accordance with the American Society of Mechanical Engineers (ASME) Pressure Vessel Code stamped with the ASME "U" symbol stamp and registered with the National Board of Boiler and Pressure Vessel Inspectors. These tanks must be inspected by the Department of Labor, Boiler and Pressure Vessel Division after installation but prior to operation. Tank shall be manufactured to UTILITY's specifications and have a rated working pressure of at least 125 psi. Size of tank with number and size of outlets will be specified by the UTILITY. The minimum size tank accepted by UTILITY for a community water system shall be 5,400-gallons
- 5.1.2 The contractor shall set tank complete with pedestals as per plans.
- 5.1.3 Pedestals shall be excavated to solid compact ground (at least 36" below ground) and poured of 3,500 psi concrete (or 3,000 psi concrete with an additive) to form to the tank with a 12" dip at the center. Alternatively, steel saddles may be used to cradle the tank and shall sit firmly on top of the concrete pedestals. Pedestals shall be set on solid, compact ground with a minimum bearing capacity of 2500 psf. The first pedestal shall be no further than 10' from the house without UTILITY approval. The width shall be 2' with a length of 6' for 5,400-gallon tanks. The width shall be 30" with a length of 8' and a depth of 48" for 10,000-gallon tanks. Pedestals for other tank sizes shall be as specified by UTILITY. Forms shall be removed after 48 hours. Pedestal finish shall be smooth. The bottom of the tank shall be 18" above finish elevation of the ground beneath it.
- 5.1.4 Before setting the tank, the tank shall be painted with the appropriate finish and allowed to dry for 7 days. [Tank Coating shall comply with AWWA D102.](#) The two surfaces must be separated by a rubber or dense polypropylene material as specified by UTILITY. See Division 3 Section 7 for appropriate materials.
- 5.1.5 The tank shall be air cured for a minimum of 14 continuous days before filling.
- 5.1.6 The tank shall be thoroughly flushed to remove any sediment or foreign matter. A chlorine solution, in concentrations sufficient to produce a chlorine residual of at least 50-ppm, shall be introduced to overflow the tank. The chlorine solution shall remain in contact with the interior surfaces for a period of 24 hours. The tank then shall be thoroughly flushed with the free chlorine residual solution not to exceed 2 ppm after flushing. The tank shall not be placed into service until bacteriological test results are found to be satisfactory.

5.2 Ground Level Storage Tanks

- 5.2.1 Ground storage tank shall be installed in accordance with the design specifications completed by a licensed engineer in the State of North Carolina. Said design shall be approved by UTILITY and shall comply with all County, State, and Federal requirements. Ground Storage tanks shall be constructed in accordance with the American Society of Mechanical Engineers (ASME) Code. Tanks shall be manufactured to UTILITY specifications and size.
- 5.2.2 Design and its fabrication must comply with AWWA Standards D 100 of the American Water Works Association, Inc. Tank Coating shall comply with AWWA D102. Foundations and support structures must comply with standard ACI 318. All accessory items installed shall be in full conformity with the current applicable OSHA safety regulations and the operating requirements of the structure. At a minimum if the tank is taller than 8 feet, a fixed ladder or form of access/egress must be installed in accordance with OSHA and AWWA standards and recommendations.
- 5.2.3 The Contractor shall provide working drawings and design calculations for the tank and the foundation. Drawings shall show the size and location of all structural components and reinforcement, the required strength and grade of all materials and the size and arrangement of principle piping and equipment. The drawings and calculations shall bear the certification of a professional Engineer licensed in the State of North Carolina.
- 5.2.4 A sanitary, screened vent and overflow of the proper size shall be installed on the top of the tank.
- 5.2.5 Probes of 316 stainless steel and all necessary controls for operation and monitoring of the water levels shall be installed in accordance with the UTILITY specifications and/or the approved plans. The number and settings for these probes shall be determined by the UTILITY and/or the approved plans.
- 5.2.6 The tank shall be all-welded construction of the most economical design. All members of structural steel shall be designed to safely withstand the maximum stresses to which they may be subjected during erection and operation.

Division 3

Section 6

Well House

6.1 Pad

- 6.1.1 The well house pad at minimum shall measure 10' x 10' by 6-inches thick. The footer and the slab shall be a continuous pour. The pad and foundations shall meet the international building code and all state and local regulations as it pertains to the appropriate building structure, at a minimum it shall be constructed as shown in the Standard Details.. The wellhead pad shall extend a minimum of 8' 6" from well house pad and allow for a continuous bond concrete extending three feet horizontally around the outside of the well casing as per plans.
- 6.1.2.1 The well house pad shall be a minimum of 6" thick with 12" X 12" footings and a 1/2" slope to the drains. Concrete shall have a compressive strength of 3,000 psi.
- 6.1.2.2 The wellhead concrete pad shall be 8" thick with 12" x 12" footings and join with the well grout. Forms shall be level and square.
- 6.1.2 A 4" floor drain with pea-trap shall be installed in the center of the well house. The under-floor piping shall be Schedule 40 PVC. It shall be installed with a 0.5 % slope. The top of the pipe shall have a minimum of 12" of cover, and it shall extend a minimum of 20' away from the well house or as directed by UTILITY. No standing water shall be allowed. Necessary measures including ditching and riprap may be required depending in site conditions.
- 6.1.3 Finished elevation of the pad shall be 3" to 4" above the surrounding ground and the site shall be graded so as not to allow runoff water to enter the building.
- 6.1.4 The edges of the pad shall be smooth.
- 6.1.5 Concrete shall be poured and installed in accordance with industry standards.
- 6.1.6 After the pad is poured and has set for at least 24 hours, forms shall be dismantled and removed from the site.
- 6.1.7 No slab penetrations shall be allowed except wellhead and drain. All additional piping shall be routed outside of building footprint prior to burying.

6.2 Block

- 6.2.1 A row of 6" block is required around the perimeter of the building complete with 3/8"

anchor bolts as per plans for wood framed well houses or in accordance with local permitting standards.

- 6.2.2 Blocks and mortar joints shall be level and free of cracks and shall be filled with concrete.

6.3 Wood Building

- 6.3.1 The contractor shall build house complete with a 36", single, aluminum, powder coated, exterior door as per Well House Framing Detail (See Drawing W-31).

- 6.3.2 Pressure treated 2" x 6" lumber shall be used as the seal plate and bolted to the anchor bolts or in accordance with County standards.

- 6.3.3 Joists shall be on 16" centers.

- 6.3.4 Ceiling joists shall be a minimum of 8' above finished floor.

- 6.3.5 Siding shall be 5 1/4" x 8" x 5/16" fiber cement board (or approved equal), installed per manufacturer's recommendations. Color to be selected by UTILITY (see Division 3 Section 7.2). Alternatives will be submitted to UTILITY for approval.

- 6.3.6 The well cover house shall be 24" above finished block to the top of the wall. Well cover size shall not exceed 36" wide and 7' long.

- 6.3.7 A gable vent or ridge vent shall be installed with a soffit vent for proper roof ventilation.

- 6.3.8 Two - 8" x 16" automatic foundation vents with wire security grating shall be installed 6" above the block on the back sides of the well house. Two 8" x 16" closing vents shall be installed in the front ceiling to allow heat to dissipate out through the roof in the summer.

- 6.3.9 Hasps shall be installed on well cover roof.

- 6.3.10 If building is to be built of any material other than wood, plans shall be approved by UTILITY in writing.

- 6.3.11 Interior Walls shall be backed with faced batt insulation and finished out with 1/2" plywood and painted white.

- 6.3.12 A well head protection sign (provided by UTILITY) shall be installed on each well house as well as a well identification number.

6.4 Roofs

- 6.4.1 A gable style roof shall be built with 4/12 pitch.

- 6.4.2 Covering shall be 1/2" OSB with 30# felt paper and (golden or autumn brown) architectural shingles with 20-year warranty.

- 6.4.3 Well cover roof shall be removable by sliding and flashed with 1.5" x 1.5" angle iron to

house.

6.4.4 All eaves shall be boxed in. Fascia shall be constructed of fiber cement board.

6.4.5 Metal drip edge material shall be installed at all exposed edges of the roof decking.

6.5 Insulation

6.5.1 All wood houses shall be constructed with R-15 faced batt insulation in the walls and R-30 fiberglass insulation in the ceilings. Construction in Alleghany, Ashe, Avery, Mitchell, and Yancey counties require R-19 fiberglass insulation in walls.

6.5.2 All block houses shall have insulation poured to the top of the block in each block cavity.

6.6 Commercial Size Well Houses

6.6.1 If structure is larger than 144 square feet, it shall comply with all local fire regulations (i.e. access road, address, fire extinguisher, etc.)

6.7 Satellite Well Houses

6.7.1 Installation of a satellite well house shall be at the discretion of the UTILITY.

6.7.2 Please refer to the Satellite Well House cut sheets attached to these specifications for complete construction details.

Division 3

Section 7

Painting

7.1 Paint Products

- 7.1.1 Materials specified are those that have been approved by the UTILITY. Products of the Sherwin Williams Company and the Tnemec Company are listed to establish a standard of quality. Equivalent materials of other manufacturers may be substituted on written approval of the UTILITY.
- 7.1.2 Requests for substitution shall include manufacturer's literature for each product giving the name, product number, generic type, descriptive information, solids by volume, recommended dry film thickness, and manufacturer's color charts.
- 7.1.3 Requests for substitution shall be submitted for approval at least 30 days prior to paint application.

7.2 Houses

- 7.2.1 Wood houses shall have at least two coats of Sherwin Williams A-100, latex flat exterior Plantation Brown paint applied to house and the trim.
- 7.2.2 Blockhouses shall be sealed and then have two coats of Sherwin Williams latex flat exterior A-100 Plantation Brown 90224.

7.3 New Hydro-pneumatic Tanks

- 7.3.1 Interior - Epoxy
 - 7.3.1.1 Surface Preparation: Steel Structures Painting Council (SSPC) SP10, Near White Metal Blasting Cleaning. After surface preparation and prior to painting, all unwelded seams will be filled with Tnemec Series 63-1500 Filler and Surfacer.
 - 7.3.1.2 1st Coat: Tnemec Series N140F-1255 Beige Pota-Pox primer at 4 dry mils per manufacturer's recommendation.
 - 7.3.1.3 2nd Coat: Tnemec Series N140F-00 Tank White Pota-Pox finish at 5 dry mils per manufacturer's recommendation. After installation of final coat, interior shall be force cured for a minimum 24 hours with heated air.
 - 7.3.1.4 A minimum of fourteen (14) days cure time shall be allowed before being placed into service.

7.3.1.5 Manufacturer approved thinners for specific Series and applications shall be used. Total dry film thickness shall be a minimum 9 dry mils per SSPC dry film thickness measuring standards.

7.3.2 Exterior - Epoxy / Polyurethane

7.3.2.1 Surface preparation: Steel Structures Painting Council (SPCC) SP10, Near White Metal Blast Cleaning.

7.3.2.2 1st Coat: Tnemec Series N14F-1255 Beige Pota-Pox Primer at 3.0 dry mils.

7.3.2.2 2nd Coat: Tnemec Series 1074 Endura-Shield (Color 84BR Weathered Bark) at 4.0 dry mils.

7.3.2.3 3rd Coat: Tnemec Series 1074U Endura-Shield (Color 84BR Weathered Bark) at 3.0 dry mils.

7.3.2.4 A minimum of seven (7) days cure time shall be allowed before placing into service.

7.3.2.5 Manufacturer approved thinners for specific Series and applications shall be used. Total dry film thickness of the new system shall be a minimum 10 dry mils.

7.3.3 Cathodic Separation protection

Cathodic Protection Material of $\frac{3}{4}$ inches minimum thickness shall be placed between the tank and the pedestals. This material will be wide enough and long enough to cover any areas that the tank and pedestals could possibly come into contact with each other.

7.3.4 Disinfection

All Hydro-pneumatic tanks shall be disinfected in accordance with North Carolina State Regulations and pass a bacteriological test.

A VOC sample may be collected by the UTILITY at its discretion.

Division 3

Section 8

Electrical

- 8.0 Maintenance Employee Safety is of the utmost importance. When devices are engineered and available that could limit incidents such as Arch-Flash, then equipment, panels, and boxes with design features built into them will be specified and used.
- 8.1 All electrical work shall be installed under a licensed electrician and shall pass all local and State inspection requirements.
- 8.2 **Services**
- 8.2.1 All new installations shall be equipped with power service.
- 8.2.2 Only copper conductors will be accepted for the service.
- 8.2.3 A grounding electrode of adequate size shall be connected to the well casing with two (2) driven electrode rods of 3/4" Minimum diameter. Driven grounding Rods shall be at least ten (10) feet apart. A ground test shall be performed and data presented to the UTILITY to insure adequate grounding is achieved.
- 8.2.4 All services shall have a minimum 200-amp meter base.
- 8.3 **Panels**
- 8.3.1 All control panels, transfer switches, meter, bases, branch circuit panels, electric boxes, motor control boxes, etc shall be NEMA rated as follows:
- Located/mounted in the interior of a wellhouse/building shall be NEMA 4X
- Located/mounted on the exterior of a wellhouse/building/remote well site (even if under a shed or building roof overhang) shall be NEMA 4X
- 8.3.2 Main well house panel shall be as specified by the UTILITY in Section 5, and shall be interior, surface mounted with a main breaker of specified size with a minimum of 16 circuits. Panels shall be a minimum of 200 Amp rated and include a NEMA 4X enclosure as specified above. Panels shall be ITE with copper busway.
- Remote well house panels shall be identical to above in amp size, ITE with copper busway and minimum circuit rating. It shall be mounted in according to the Standard details and shall be NEMA Rated as listed above.
- 8.3.3 Each panel shall be provided with lightning arresters, Cutler Hammer CHS-A01 or equal.
- 8.3.4 When wiring is finished, the panel shall be labeled as to which breaker feeds what load.

- 8.3.5 Wiring loads shall be balanced in panels.
- 8.3.6 One 20 amp single pole breaker shall be installed as a spare in each panel.
- 8.3.7 All electrical outlets shall be protected by GFI breakers.

8.4 Magnetic Starters

- 8.4.1 As specified in Section 5, NEMD standard, with hand off/automatic (HOA) and an indicator light shall be used unless otherwise approved by the UTILITY. An Intermatic Model FF5M spring wound 5 minute timer switch shall be installed with a permanently marked cover to control the “auto-on” of the pump.
- 8.4.2 Each starter shall have two sets of normally open auxiliary contacts provided.
- 8.4.3 An adequate thermal overload shall be provided in each leg of the starter, as specified in the pump and motor manufacturer’s specification book or attached chart.
- 8.4.4 Size of the starter will be determined by UTILITY.
- 8.4.5 Magnetic starts shall be Allen Bradley, NEMA 3R with 120 VAC coil.

8.5 Pressure Switches

If required, an Allen Bradley 835T-T253J (or UTILITY-approved equivalent) pressure switch will be installed.

8.6 Indicating Controls

An elapsed time meter and an impulse counter shall be mounted and wired by the contractor. Said elapsed time meter and impulse counter shall be selected from the attached materials list.

8.7 Telemetry/Radio Controls

- 8.7.1 If required, telemetry and/or radio controls will be designed and installed as approved by UTILITY at UTILITY’s cost.
- 8.7.2 .UTILITY will pay for any SCADA equipment required.

8.8 Air Compressor

Where a hydro-pneumatic tank is installed, a compressor and controls shall be installed. Said compressor shall be selected from the attached parts list specified by UTILITY.

8.9 Chemical Receptacle

Three discrete circuit 115 VAC duplex GFI/GFCI receptacles shall be installed as shown in the Standard Details or as specified by the UTILITY. These receptacle outlets shall be permanently marked as “chemical”.

8.10 Utility Receptacles

Two 115 VAC utility receptacle that are energized constantly and protected by a ground fault interrupter in addition to the breaker shall be installed. These receptacle outlets shall be permanently marked as "utility". One shall be located on the chemical panel side of house and one shall be located on the electrical panel side of house.

8.11 Lights

One LED vapor-tight ceiling mount fixture manufactured by LSI industries, model EG34SLEDHOCWUSEL, or equal, is required in each well house and shall be controlled from a wall switch at the entrance.

8.12 Heating

8.12.1 For a standard 10 X 10 well house, there shall be one four-foot 1,000-watt 240 volts AC baseboard heater mounted 6" above block on the interior wall. If the building is larger, then additional heating may be required.

8.12.2 The baseboard heater shall be controlled by a remote bulb thermostat. Thermostat shall be manufactured by White-Rodgers, Model #2B61-186.

8.12.3 If more than one baseboard heater is required baseboard heaters shall be substituted with one 3.3 kW unit heater.

8.13 Wire

8.13.1 All wire shall be copper of THW or THHN type and of adequate size.

8.14 Raceways

8.14.1 All raceways underground shall be minimum 2" schedule 40 PVC.

8.14.2 All exposed conduit shall be a sized according to conduit fill with exception of service masts which shall be of 2" rigid conduit.

8.14.3 Liquid tite flex or Carflex with the proper fittings shall be used from the well to the junction boxes, etc.

8.14.4 One hole or minerallic straps shall be used on all raceways in accordance with the N.E.C.

8.14.5 All building interior conduit shall be PVC

8.15 Fittings

8.15.1 PVC FS switch boxes shall be used for receptacles and switches.

8.15.2 Boxes and Fittings used with PVC pipe shall be of the PVC type.

8.16 Manual Transfer Switch

- 8.16.1 Equipment shall conform to the requirements of NFPA 70.
- 8.16.2 Products shall be listed and classified by UL or other North Carolina Recognized Third Party Testing Agency.
- 8.16.3 Equipment shall be NEMA ICS 10, manual transfer switch suitable for use as service equipment. Load side lugs shall be suitable for connection of two conductors per phase. The second set of conductors will be #6 AWG for connection to a surge protective device.
- 8.16.4 Ratings shall be for 480 volts, three phase, four wire, 60 Hz. 400A continuous rating or greater.
- 8.16.5 Enclosure shall be NEMA ICS 6, Type 3X.
- 8.16.6 Generator connections shall be installed in the base of the transfer switch. The connectors shall be Hubbell Single Pole Receptacles meeting the following:

400-amp panel mount
Mates with 300 or 400-amp plugs
Rated to 600 volts
Contact material shall be brass

Color sequence AND receptacle designations shall be as follows – Left to Right facing the transfer switch:

Single Phase installations:

Blue Male Receptacle, Black Male Receptacle, Green FEMALE Receptacle

Three Phase Installations:

Blue Male Receptacle, Orange Male Receptacle, Black Male Receptacle, Green FEMALE Receptacle

Division 3

Section 9

Excavation, Backfill, Compaction, Grading, & Restoration

9.1 General

This Section covers excavation, backfill, compaction, grading and restoration associated with utility trench and structural construction. All such WORK shall be performed by the CONTRACTOR concurrently with the WORK specified in these SPECIFICATIONS. The CONTRACTOR shall furnish all labor, materials, equipment and incidentals necessary to perform all excavation, backfill, fill, compaction, grading and slope protection required to complete the WORK shown on the DRAWINGS and specified herein. The WORK shall include, but not necessarily be limited to: pump stations, manholes, vaults, conduit, pipe, roadways and paving; all backfilling, fill and required borrow; grading; disposal of surplus and unsuitable materials; and all related WORK such as sheeting, bracing and water handling.

9.2 Soil Borings and Subsurface Investigations

Subsurface exploration and geotechnical engineering evaluation where provided is for the CONTRACTOR'S information only. Data on indicated subsurface conditions are not intended as representations or warranties of accuracy or continuity between soil borings.

The CONTRACTOR shall examine the site and undertake additional subsurface investigations including soil borings, if so desired, before commencing the WORK. UTILITY will not be responsible for presumed or existing soil conditions in the WORK area.

9.3 Existing Utilities

CONTRACTOR shall locate existing utilities in the areas of WORK. If utilities are to remain in place, the CONTRACTOR shall provide adequate means of protection during earthwork operations. Should uncharted or incorrectly charted piping or other utility conflicts encountered during excavation, the CONTRACTOR shall consult the owner of such piping or utility immediately for directions. Payment for damage and repair to such piping or utilities is the contractor's responsibility. Refer to Section 10.2 for utility coordination requirements.

UTILITY shall not be responsible for uncharted or incorrectly charted water and wastewater mains or other utilities. It is the contractor's responsibility to ensure that such facilities exist at the presumed point prior to commencing construction.

9.4 Materials

9.4.1 General: Materials for use as bedding and backfill, whether in-situ or borrow, shall be as described under this Section. The CONTRACTOR shall upon request by UTILITY, make an appropriate sample of this material available for testing by UTILITY or its

designated representative.

- 9.4.2 Structural Fill: Materials for structural fill shall be bedding rock or select common fill as specified herein or other suitable material as approved by UTILITY.
- 9.4.3 Common Fill: Common fill shall consist of material substantially free of organic material, loam, wood, trash and other objectionable material which may be compressible or which cannot be compacted properly. Common fill shall not contain stones larger than 4 inches in any dimension, asphalt, broken concrete, masonry, rubble or other similar materials. It shall have physical properties such that it can be readily spread and compacted during filling. Additionally, common fill shall be no more than 12 percent by weight finer than the No. 200 mesh sieve unless finer material is approved for use in a specific location by UTILITY.
- 9.4.4 Select Common Fill: Select common fill shall be as specified above from common fill, except that the material shall contain no stones larger than 1-1/2 inches in largest dimension, and shall be no more than 5 percent by weight finer than the No. 200 mesh sieve.
- 9.4.5 Bedding Rock: Bedding rock shall be 3/16 inch to 3/4 inch washed and graded stone (NCDOT #57). This stone shall be graded so that 90 to 100 percent will pass a 3/4 inch screen and 95 to 100 percent will be retained on a No. 8 screen. No stones larger than 1 inch in any dimension shall be accepted.

9.5 Dewatering, Drainage and Flotation

- 9.5.1 General: The CONTRACTOR shall excavate, construct and place all pipelines, concrete work, fill, and bedding rock, in-the-dry. In addition, the CONTRACTOR shall not install the final 24-inches of excavation until the water level is a minimum of one foot below the proposed bottom of excavation. For purposes of these SPECIFICATIONS, "in-the-dry" is defined to be within 2% of the optimum moisture content of the soil. UTILITY reserves the right to ask the CONTRACTOR to demonstrate that the water level is a minimum of one foot below proposed bottom of excavation before allowing the construction to proceed.

Discharge from dewatering shall be disposed of in such a manner that it will not interfere with the normal drainage of the area in which the WORK is being performed, create a public nuisance, or form ponding. No flooding of streets, driveways or private property will be permitted. The operations shall not cause injury to any portion of the WORK completed, or in progress, or to the surface of streets, or to private property. The dewatering operation shall comply with the requirements of appropriate regulatory agencies. Additionally, where private property will be involved, advance permission shall be obtained by the CONTRACTOR. Engines driving dewatering pumps shall be equipped with residential type mufflers. Where feasible, electrical "drops" shall be used in lieu of portable generators.

- 9.5.2 Additional Requirements: The CONTRACTOR shall, at all times during construction, provide and maintain proper equipment and facilities to remove promptly and dispose of properly all water entering excavations. The CONTRACTOR shall keep such excavations dry so as to obtain a satisfactory undisturbed subgrade foundation condition until the fill, structure, or pipelines to be built thereon have been completed.

Dewatering shall at all times be conducted in such a manner as to preserve the natural undisturbed bearing capacity of the subgrade soils at the proposed bottom of the excavation.

It is expected that wellpoints will be required for pre-drainage of the soils prior to final excavation for some of the deeper in-ground structures or piping and for maintaining the lowered groundwater level until construction has been completed to such an extent that the structure, pipeline or fill will not be floated or otherwise damaged. Wellpoints shall be surrounded by suitable filter sand and negligible fines shall be removed by pumping.

The CONTRACTOR shall furnish all materials and equipment and perform all work required to install and maintain the drainage systems for handling groundwater and surface water encountered during construction of structures, pipelines and compacted fills.

If required during backfilling and construction, water levels shall be measured in observation wells located as directed by UTILITY.

Continuous pumping will be required as long as necessary until completion of below grade activity.

9.6 Excavation

9.6.1 Excavation for Structures: All such excavations shall conform to the elevations and dimensions shown on the DRAWINGS within a tolerance of plus or minus 0.10 feet and extending a sufficient distance from footings and foundations to permit placing and removal of formwork, installation of services and other construction, inspection or as shown on the DRAWINGS. In excavating for footings and foundations, care shall be exercised not to disturb the bottom of the excavation. The bottom of excavations shall be rendered firm and dry before placing any structure or concrete.

9.6.2 Trench Excavation: Excavation for all trenches required for the installation of utility pipes shall be made to the depths indicated on the DRAWINGS and in such manner and to such widths as will give suitable room for installing the pipe within the trenches, for bracing and supporting and for pumping and drainage facilities.

The bottom of the excavations shall be firm and dry and in all respects acceptable to UTILITY.

Excavation shall not exceed normal trench width or depth as specified in the STANDARD DETAILS. Any excavation which exceeds the normal trench depth shall require special backfill requirements as determined by UTILITY.

Where pipes are to be installed on bedding rock, select common fill or encased in concrete, the trench may be excavated by machinery to or just below the designated subgrade provided that the material remaining in the bottom of the trench is no more than slightly disturbed.

Where pipes are to be installed directly on the trench bottom, the lower part of the trenches shall not be excavated to grade by machinery. The last of the material being

excavated shall be done manually in such in a manner that will give a shaped bottom, true to grade, so that pipe can be evenly supported on undisturbed material, as specified in the STANDARD DETAILS. Bell holes shall be made as required.

9.7 Bedding and Backfill

- 9.7.1 General: Material placed in fill areas under and around structures and pipelines shall be deposited within the lines and to the grades shown on the DRAWINGS or as directed by UTILITY, making due allowance for settlement of the material. Fill shall be placed only on properly prepared surfaces which have been inspected and approved by UTILITY. If sufficient select common or common fill material is not available from excavation on site, the CONTRACTOR shall provide fill as may be required.

Fill shall be placed and spread in layers by a backhoe or other approved method, unless otherwise specified. Prior to the process of placing and spreading, all materials not meeting those specified under Division 3, Section 9.4 shall be removed from the fill areas. The CONTRACTOR shall assign a sufficient number of men to this WORK to insure satisfactory compliance with these requirements.

All fill materials shall be placed and compacted "in-the-dry." The CONTRACTOR shall dewater excavated areas as required to perform the work and in such manner as to preserve the undisturbed state of the natural inorganic soils.

Prior to filling, the ground surface shall be prepared by removing vegetation, debris, unsatisfactory soil materials, obstructions and deleterious materials. CONTRACTOR shall plow strip or break up sloped surfaces steeper than one vertical to four horizontal so that fill material will bond with the existing surface. When existing ground surface has a density less than that specified under Division 3, Section 12.9 for the particular area classification, CONTRACTOR shall break up the ground surface, pulverize, moisture-condition to the optimum moisture content and compact to required depth and percentage of maximum density.

Before compaction, material shall be moistened or aerated as necessary to provide the optimum moisture content. Material which is too wet shall be spread on the fill area and permitted to dry, assisted by harrowing if necessary, until the moisture content is reduced to allowable limits. If added moisture is required, water shall be applied by sprinkler trucks or other sprinkler systems, which will insure uniform distribution of the water over the area to be treated and give complete and accurate control of the amount of water to be used. If too much water is added, the area shall be permitted to dry before compaction is continued. The CONTRACTOR shall supply all hose, piping, valves, sprinklers, pumps, sprinkler trucks, hauling equipment and all other materials and equipment necessary to place water on the fill in the manner specified. CONTRACTOR shall compact each layer to required percentage of maximum dry density or relative dry density in accordance with Division 3, Section 9.9. Backfill or fill material shall not be placed on surfaces that are muddy, frozen or contain frost or ice.

- 9.7.2 Bedding and Backfill for Structures: Bedding rock shall be used for bedding under all structures as indicated on the STANDARD DETAILS. The CONTRACTOR shall take all precautions necessary to maintain the bedding in a compacted state and to prevent washing, erosion or loosening of this bed. Structural fill shall be used as backfill against the exterior walls of the structures. Fill shall be compacted sufficiently in accordance

with Division 3, Section 9.9.2 of these SPECIFICATIONS. If compaction is by rolling or ramming, material shall be wet down as required.

Backfilling shall be carried up evenly on all walls of an individual structure. No backfill shall be allowed against walls until the walls and their supporting slabs, if applicable, have attained sufficient strength.

In locations where pipes pass through building walls, the CONTRACTOR shall take precautions to consolidate the fill up to an elevation of at least one (1) foot above the bottom of the pipes. Structural fill in such areas shall be placed for a distance of not less than three (3) feet either side of the center line of the pipe in level layers not exceeding eight (8) inches in depth.

The surface of filled areas shall be graded to smooth true lines, strictly conforming to grades indicated on the DRAWINGS. No soft spots or uncompacted areas will be allowed in the WORK.

Temporary bracing shall be provided as required during construction of all structures to protect partially completed structures against all construction loads, hydraulic pressure and earth pressure. The bracing shall be capable of resisting all loads applied to the walls as a result of backfilling.

- 9.7.3 Bedding and Backfill for Pipes: Bedding for pipe shall be as shown on the PLANS and detailed on the STANDARD DETAILS. The CONTRACTOR shall take all precautions necessary to maintain the bedding in a compacted state and to prevent washing, erosion or loosening of this bed.

Backfilling over and around pipes shall begin as soon as practicable after the pipe has been installed, jointed and inspected. All backfilling shall be prosecuted expeditiously and as detailed on the STANDARD DETAILS.

Any space remaining between the pipe and sides of the trench shall be carefully backfilled and spread by hand or approved mechanical device and thoroughly compacted with a tamper as fast as placed, up to a level of one (1) foot above the top of the pipe. The filling shall be carried up evenly on both sides. Compaction shall be in accordance with the STANDARD DETAILS and Division 3, Section 9.9.

The remainder of the trench above the compacted backfill (as just described above) shall be filled and thoroughly compacted in uniform layers. Compaction shall be in accordance with the STANDARD DETAILS and Division 3, Section 9.9.

9.8 Compaction

- 9.8.1 General: The CONTRACTOR shall control soil compaction during construction to provide the percentage of maximum density specified. The CONTRACTOR shall provide UTILITY copies of all soils testing reports prepared by a GEOTECHNICAL/SOILS ENGINEER, demonstrating compliance with these SPECIFICATIONS.

When existing trench bottom has a density less than that specified under Division 3, Section 9.9.2, the CONTRACTOR shall break up the trench bottom surface, pulverize,

moisture-condition to the optimum moisture content and compact to required depth and percentage of maximum density.

- 9.8.2 Percentage of Maximum Density Requirements: Fill or undisturbed soil from the bottom of the pipe trench to 1 foot above the pipe shall be compacted to a minimum density of 95% of the maximum dry density as determined by AASHTO T-180.

Non-Paved Areas: Backfill from 1 foot above utility pipe to grade shall be compacted to a minimum density of 95% of the maximum dry density as determined by AASHTO T-180.

Paved Areas: Backfill from 1 foot above utility pipe to bottom of subgrade shall be compacted to a minimum density of 98% of the maximum dry density as determined by AASHTO T-180.

Fill under and around structures, and to the extent of the excavation shall be compacted to a minimum density of 95% of the maximum dry density as determined by AASHTO T-180.

- 9.8.3 Compaction Tests: If the UTILITY deems it necessary, compaction tests can be required. The locations of compaction tests within the trench shall be in conformance with the following schedule, as determined by the UTILITY:

- One test at the spring line of the pipe.
- At least one test for each 12" layer of backfill within the pipe bedding zone for pipes 24 inches and larger.
- One test at an elevation of one foot above the top of the pipe.
- One test for each two feet of backfill placed from one foot above the top of the pipe to finished grade elevation.

If based on GEOTECHNICAL/SOILS ENGINEER testing reports and inspection, fill which has been placed is below specified density, CONTRACTOR shall provide additional compaction and testing prior to commencing further construction.

9.9 Topsoil

- 9.9.1 Strip topsoil from within limits of earthwork operations as specified. Topsoil shall be a fertile, friable, natural topsoil of loamy character and characteristic of locality. Topsoil shall be capable of growing healthy horticultural crops of grasses. Stockpile topsoil and protect as directed by Resident Engineer. Eliminate foreign materials, such as weeds, roots, stones, subsoil, frozen clods, and similar foreign materials larger than 1/2 cubic foot in volume, from soil as it is stockpiled. Retain topsoil on station. Remove foreign materials larger than 50 mm (2 inches) in any dimension from topsoil used in final grading. Topsoil work, such as stripping, stockpiling, and similar topsoil work shall not, under any circumstances, be carried out when soil is wet so that the composition of the soil will be destroyed.

- 9.9.2 Topsoil shall be uniformly redistributed in a 4-8-inch layer and lightly compacted to a minimum thickness of 4 inches. Any irregularities in the surface resulting from topsoiling or other operations shall be corrected in order to prevent formation of depressions or

water pockets. Topsoil shall not be placed while in frozen or muddy condition, when subsoil is excessively wet or in and condition detrimental to proper grading.

9.9.3 Erosion and sedimentation controls must be maintained when applying topsoil.

9.10 Grading

All areas within the limits of construction, including transition areas, shall be uniformly graded to produce a smooth uniform surface. Areas adjacent to structures or paved surfaces shall be graded to drain away from structures and pavement. Ponding shall be prevented. After grading, the area shall be compacted to the specified depth and percentage of maximum density.

No grading shall be done in areas where there are existing pipelines that may be uncovered or damaged, until such lines have been relocated.

9.11 Maintenance

CONTRACTOR shall protect newly graded areas from traffic and erosion and keep them free of trash and debris. CONTRACTOR shall repair and reestablish grades in settled, eroded and rutted areas.

Where completed compacted areas are disturbed by subsequent construction operations or adverse weather, CONTRACTOR shall scarify surface, reshape and compact to required density prior to further construction.

9.12 Inspection and Quality Assurance

9.12.1 Inspection: CONTRACTOR shall examine the areas and conditions under which excavating, filling and grading are to be performed, and not proceed with the WORK until unsatisfactory conditions have been corrected.

CONTRACTOR shall examine existing grade prior to commencement of WORK and report to UTILITY if elevations of existing grade vary from elevations shown on DRAWINGS.

9.12.2 Quality Assurance: All work shall be performed in compliance with applicable requirements of governing authorities having jurisdiction.

The CONTRACTOR, at his expense, shall engage soil testing and inspection services for quality control testing during earthwork operations. The testing and inspection service shall be subject to the approval of UTILITY.

Quality control testing shall be performed during construction to ensure compliance with these SPECIFICATIONS. CONTRACTOR shall allow the testing service to inspect and approve fill materials and fill layers before further construction is performed. The CONTRACTOR shall give copies of all test results in a report form to UTILITY to demonstrate compliance with compaction requirements stipulated in this MANUAL.

Division 3

Section 10

Boring and Jacking

10.1 General

The installation of a casing pipe by the method of boring and jacking shall be covered by these SPECIFICATIONS. The overall work scope shall include, but not be limited to, boring and jacking pits and equipment, sheeting, steel casing pipe, spacers, coatings, location signs as required, miscellaneous appurtenances to complete the entire WORK as shown on the STANDARD DETAILS, and restoration. Applicable provisions of Division 3 shall apply concurrently with these SPECIFICATIONS. Boring and jacking operations shall be performed within the right-of-way and/or easements shown on the DRAWINGS.

10.2 Pipe Material

10.2.1 Steel Casing: Steel casings shall conform to the requirements of ASTM Designation A 139 (straight seam pipe only) Grade "B" with minimum yield strength of 35,000 psi. The casing pipes shall have the minimum nominal diameter and wall thickness as shown on the following table:

Carrier Pipe Nominal Diameter	Casing Outside Diameter	Casing Wall Thickness (Hwy)	Casing Wall Thickness (RR)
4"	14"	.250"	.250"
6"	16"	.250"	.250"
8"	18"	.250"	.312"
10"	22"	.250"	.375"
12"	24"	.250"	.375"
14", 16"	30"	.312"	.500"
18", 20"	36"	.375"	.563"
24"	48"	.500"	.625"
The inside diameter of the casing pipe shall be a minimum of 3 inches greater than the outside diameter of the carrier pipe bell or coupling.			

Field and shop welds of the casing pipes shall conform to the American Welding Society (AWS) standard specifications. Field welds shall be complete penetration, single-bevel groove type joints. Welds shall be airtight and continuous over the entire circumference

of the pipe and shall not increase the outside pipe diameter by more than 3/4 inch.

Casings shall extend a minimum of 5 feet beyond paved areas.

10.2.2 Carrier Pipe: The carrier pipe shall be minimum class 50 ductile iron pipes with restrained joints. Ductile iron pipe shall comply with the specification outlined in Division 3, Section 1 of these SPECIFICATIONS.

10.2.3 Inspection: All casing pipe to be installed may be inspected at the site of manufacture for compliance with these SPECIFICATIONS by an independent laboratory selected and paid for by UTILITY. The manufacturer's cooperation shall be required in these inspections.

All casing pipe shall be subjected to a careful inspection prior to being installed. If the pipe fails to meet the specifications, it shall be removed and replaced with a satisfactory replacement at no additional expense to UTILITY.

10.3 Pipe Handling

Care shall be taken in loading, transporting, and unloading to prevent injury to the pipe or coatings. Pipe shall not be dropped. All pipes shall be examined before installation, and no piece shall be installed which is found to be defective. Any damage to the pipe or coatings shall be repaired to the satisfaction of UTILITY.

10.4 Construction Requirements

10.4.1 Work Coordination: It shall be the contractor's responsibility to perform the boring and jacking work in strict conformance with the requirements of the agency in whose right-of-way or easement the work is being performed. Any special requirements of the agency such as insurance, flagmen, etc., shall be strictly adhered to during the performance of WORK. The special requirements shall be performed by the CONTRACTOR at no additional cost to UTILITY.

10.4.2 Dewatering: Dewatering through the casing during construction shall not be permitted. All dewatering methods shall be approved by UTILITY before construction work begins.

10.4.3 Carrier Pipe Support: The carrier pipes shall be supported within the casing pipes so that the pipe bells do not rest directly on the casing. The load of the carrier pipes shall be distributed along the casing by casing spacers. Casing spacers shall be bolt on style split shell metal spiders with bituminous coating or approved equal. All nuts and bolts shall be stainless steel. Runners shall be made of a high molecular weight polymer with inherent high abrasion resistance and a low coefficient of friction.

10.4.4 Jacking Pits: Excavation adjacent to the roads shall be performed in a manner to adequately support the roads. Bracing, shoring, sheeting or other supports shall be installed as needed. CONTRACTOR shall install suitable reaction blocks for the jacks as required. Jacking operations shall be continuous and precautions shall be taken to avoid interruptions which might cause the casing to "freeze" in place. Upon completion of jacking operations, the reaction blocks, braces, and all other associated construction materials shall be completely removed from the site.

- 10.4.5 MISCELLANEOUS REQUIREMENTS: Correct line and grade shall be carefully maintained. Earth within the casing shall not be removed too close to the cutting edge in order to prevent the formation of voids outside the casing. If voids are formed, they shall be satisfactorily filled with grout by pumping.

The sections of steel casing shall be field welded in accordance with the applicable portions of AWWA C206 and AWS D7.0 for field welded pipe joints. CONTRACTOR shall wire brush the welded joints and paint with Inertol Quick-Drying Primer 626 by Koppers Company or approved equal. After completion of jacking, CONTRACTOR shall clean the interior of the casing of all excess material.

The annular space between the carrier pipe and casing shall be filled with clean sand, if required in the Bore and Jack permit. Masonry plugs shall be installed at each open end of the casing. Plugs shall be 12" thick and suitable for restraining the earth load while allowing drainage of the casing.

Division 3

Section 11

Pressure Pipe Restraint

11.1 General

Pressure pipe fittings and other items requiring restraint shall be braced with restraining assemblies as specified in this Section.

11.2 Restrained Joint Construction

Sections of piping requiring restrained joints shall be constructed using pipe and fittings with restrained "Locked-type" joints manufactured by the pipe and fitting manufacturer and the joints shall be capable of holding against withdrawal for line pressures of a minimum 150 psi. Mechanical joint ductile iron pipe retainer glands shall not be permitted. Any restrained joints that allow for elongation upon pressurization will not be allowed in those locations where the pipe comes out of the ground.

Restrained pipe joints that achieve restraint by incorporating cut out sections in the wall of the pipe shall have a minimum wall thickness at the point of cut out that corresponds with the minimum specified wall thickness for the remainder of the pipe.

The minimum number of restrained joints required for resisting forces at fittings and changes in direction of pipe shall be determined from the length of restrained pipe on each side of fittings and changes in direction necessary to develop adequate resisting friction with the soil.

The required lengths of restrained joint ductile iron pipe and PVC pipe shall be determined by the ENGINEER and shown in a tabular form as depicted on the "Restrained Joint Detail" in the STANDARD DETAILS.

Wherever 2-45° bends are used in place of a 90° bend and the minimum length of restrained pipe required from one 45° bend extends beyond the other 45° bend, the 2-45° bends will be considered as though a 90° bend were located midway between the 2-45° bends. No use of 90 degree bends is allowed unless approved by the UTILITY in writing.

11.3 Mechanical Restraining Devices

11.3.1 General: Mechanical Restraining Devices as specified herein may be substituted for the restrained "Locked-Type" joints. The length of pipe to be restrained shall be based on the "Restrained Joint Detail" in the STANDARD DETAILS.

11.3.2 Joint Restraint Device: Mechanical joint restraint shall be incorporated in the design of the follower gland and shall include a restraining mechanism which, when actuated, imparts multiple wedging action against the pipe, increasing its resistance as the pressure

increases. Flexibility of the joint shall be maintained after burial. Glands shall be manufactured of ductile iron conforming to ASTM A536. Restraining devices shall be of ductile iron heat treated to a minimum hardness of 370 BHN. Dimensions of the gland shall be such that it can be used with the standardized mechanical joint bell and tee-head bolts conforming to ANSI A11.11 and ANSI/AWWA C153/A21.53. Twist-off nuts shall be used to insure proper actuating of the restraining devices.

The mechanical joint restraint device shall have a working pressure of at least 150 psi with a minimum safety factor of 2:1 (this will be shown on the PLANS).

Division 3

Section 12

Connections to Pressure Mains

12.1 General

Installations of pressure connections 2" and larger shall be made in accordance with this Section.

12.2 Tapping Sleeves

12.2.1 General: Tapping sleeves shall be mechanical joint sleeves or fabricated steel sleeves as specified below. Tapping Sleeves shall meet AWWA C233 (latest version). All pressure connections to asbestos cement pipe and all "size on size" taps shall utilize mechanical joint sleeves.

12.2.2 Mechanical Joint Sleeves: Sleeves shall be cast of gray-iron or ductile-iron and have an outlet flange with the dimensions of the Class 125 flanges shown in ANSI B16.1, properly recessed for tapping valve. Glands shall be gray-iron or ductile iron. Gaskets shall be vulcanized natural or synthetic rubber. Bolts and nuts shall comply with ANSI/AWWA C111/A21.11. Sleeves shall be capable of withstanding a 200-psi working pressure.

12.2.3 Steel Tapping Sleeves: Sleeves shall be fabricated of minimum 3/8" carbon steel meeting ASTM A285 Grade C. Outlet flange shall meet AWWA C-207, Class "D" ANSI 150 lb. drilling and be properly recessed for the tapping valve. Bolts and nuts shall be high strength low alloy steel to AWWA C111 (ANSI A21.11). Gasket shall be vulcanized natural or synthetic rubber. Sleeve shall have manufacturer-applied fusion bonded epoxy coating, minimum 12 mil thickness.

12.2.4 Tapping Valves: Tapping valves shall meet the requirements of Section 22.2 except that units shall be flange by mechanical joint ends. Valves shall be compatible with tapping sleeves as specified above and specifically designed for pressure connection operations.

12.3 NOTIFICATION AND CONNECTION TO EXISTING MAINS

TO AVOID THE POSSIBILITY OF ISOLATION VALVES BEING LEFT OPEN - All connections to existing mains shall be made by the CONTRACTOR only after the connection procedure and his work scheduling has been reviewed and approved by UTILITY. All connections to existing piping will be such that the connection is made through a wet tap with tapping valve or the connection is started with a gate valve. This is to ensure that the existing system's cleanliness and sanitation is maintained until the new piping system has satisfactorily passed all test and has been disinfected The CONTRACTOR shall submit a written request to UTILITY a minimum of one (1) week prior to scheduling said connections. In his request he shall outline the following:

1. Points of connection, fittings to be used, and method of flushing and disinfection if applicable.
2. Estimated construction time for said connections.

UTILITY shall review the submittal within one (1) week after receiving it and inform the CONTRACTOR regarding approval or denial of his request. If his request is rejected by UTILITY, the CONTRACTOR shall resubmit his request modifying it in a manner acceptable to UTILITY.

All connections shall only be made on the agreed upon date and time. If the CONTRACTOR does not initiate and complete the connection work in the agreed upon manner, he shall be required to reschedule the said connection by following the procedure outlined above.

The CONTRACTOR shall not operate any valves in the system.

12.4 Installation

12.4.1 Excavation, Backfill, Compaction and Grading: The applicable provisions of Division 3, Section 9 shall apply.

12.4.2 Construction Details: Sufficient length of main shall be exposed to allow for installation of the tapping sleeve and valve and the operation of the tapping machinery. The main shall be supported on concrete pedestals or bedding rock at sufficient intervals to properly carry its own weight, plus the weight of the tapping sleeve valve and machinery. Any damage to the main due to improper or insufficient supports shall be repaired at the contractor's expense.

The inside of the tapping sleeve and valve, the outside of the main, and the tapping machine shall be cleaned and swabbed or sprayed with 10% liquid chlorine prior to beginning installation for water system pressure connections.

After the tapping sleeve has been mounted on the main, the tapping valve shall be bolted to the outlet flange, making a pressure tight connection. Prior to beginning the tapping operation, the sleeve and valve shall be pressure tested at 150 psi to ensure that no leakage will occur.

For pressure connections 12" diameter or less, the minimum diameter cut shall be 1/2" less than the nominal diameter of the pipe to be attached. For 14" through 20" installations, the minimum diameter shall be 1 1/2" less; for larger taps, the allowable minimum diameter shall be 2" to 3" less than the nominal diameter of the pipe being attached. After the tapping procedure is complete, the CONTRACTOR shall submit the coupon to UTILITY.

Adequate restrained joint fittings shall be provided to prevent movement of the installation when test pressure is applied. Provisions of Division 3, Section 11 shall apply.

Division 3

Section 13

Pipe Material for Water Mains and Service Connections

13.1 General

These SPECIFICATIONS cover the pipe, fittings, and accessory items used for water distribution systems.

Pipe used in water distribution systems shall be either polyvinyl chloride (PVC), or ductile iron pipe (DIP).

The CONTRACTOR shall be responsible for all materials furnished and storage of same, until the date of substantial completion. He shall replace at his expense all materials found to be defective or damaged in handling or storage. The CONTRACTOR shall, if requested by UTILITY, furnish certificates, affidavits of compliance, test reports, or samples for check analysis for any of the materials specified herein. All pipe delivered to project site for installation is subject to random testing for compliance with the designated specifications.

All water main materials, including pipe and fittings, shall meet NSF/ANSI 61 standards per rule .0406 of the Rules Governing Water Systems.

13.2 PVC Pipe

13.2.1 PVC Pipe: All PVC pipe of nominal diameter three (3) through twelve (12) inches shall be manufactured in accordance with AWWA Standard C900, latest edition. The PVC pipe shall have a minimum working pressure rating of 200 psi and shall have a dimension ratio (DR) of 14. Pipe shall be the same O.D. as ductile iron pipe. PVC pipe smaller than three (3) inches shall be SDR 21 Class 200.

13.2.2 Joints: PVC pipe shall have integral bell push-on type joints conforming to ASTM D3139.

13.2.2 Fittings: Fittings used with C900 PVC pipe shall be mechanical joint ductile iron or gray iron conforming to ANSI/AWWA A21.10/C110, 250 psi minimum pressure rating, or ductile iron compact fittings four (4) through twenty-four (24) inches in accordance with ANSI/AWWA A21.53/C153.

Fittings used with 3" and smaller PVC pipe shall be manufactured from virgin rigid PVC (polyvinyl chloride) compounds with a Cell Class of 12454 as identified in ASTM D 1784. All fitting shall be threaded unions Bell and spigot with elastomer gaskets, or compression type – no glue joints are to be used.

13.3 Ductile Iron Pipe & Fittings

- 13.3.1 **Ductile Iron Pipe:** All ductile iron pipe of nominal diameter (3) through fifty-four (54) inches shall conform to ANSI/AWWA A21.50/C150 and ANSI/AWWA A21.51/C151. A minimum of Class 50 pipe shall be supplied for all sizes of pipe unless specifically called out in the DRAWINGS, or required by UTILITY.
- 13.3.2 **Fittings:** Any fittings required shall be mechanical joint ductile iron or gray iron conforming to ANSI/AWWA A21.10/C110, 250 psi minimum pressure rating, or ductile iron compact fittings three (3) through twenty-four (24) inches in accordance with ANSI/AWWA A21.53/C153.
- 13.3.3 **Joints:** Joints for ductile iron pipe and fitting joints shall be push-on or mechanical joints conforming to ANSI/AWWA A21.11/C111. Where called for in the plans, restrained or flanged joints shall be provided. Flanged joints shall conform to ANSI Standard B 16.1-125 LB. Restrained joints shall conform to Division 3, Section 1, 11.3.
- 13.3.4 **Polyethylene Encasement:** The pipe shall be polyethylene encased (8 mil) where shown on the DRAWINGS or required by UTILITY in accordance with ANSI/AWWA A21.51/C105.

13.4 Service Pipe, Stops, Fittings, and Service Saddles

- 13.4.1 **Service Pipe:** All service lines shall be 3/4", 1", 1-1/2" or 2" blue polyethylene tubing conforming to specifications in AWWA C800 and AWWA C901. One and one-half inch (1-1/2") and larger shall be sized in accordance with the Iron Pipe Sizing Standard (IPS); 3/4 " and 1" shall be the Copper Tube Sizing Standard (CTS)
- 13.4.2 **Stops:** Corporation stops shall be 3/4", 1", 1-1/2" or 2" brass, equipped with connections compatible with the polyethylene tubing and threaded in accordance with specifications in AWWA C800 and AWWA C901. Curb stops shall be sized to match the meter size and conform to the specifications in AWWA C800 and AWWA C901. There will be one corporation stop at the main tap and start of the service line. There will be a second corporation stop type of ball valve placed at the end of the service line and prior to the meter yoke so that the meter yoke can be isolated. The second ball corporate stop shall be accessible from inside of the meter box.
- 13.4.3 **Fittings:** Fittings shall be brass, cast and machined in accordance with specifications in AWWA C800 and AWWA C901, with compatible polyethylene tubing connections.
- 13.4.4 **Service Saddles:** A service saddle shall be used for all service line taps. Service saddles shall be double strap, anchored by a minimum four (4) bolt pattern on a ductile iron saddle body. Service saddles for PVC pipe shall have the double strap sized exactly to the pipe outside diameter. Sealing gaskets shall be BUNA-N rubber and straps shall be corrosion resistant alloy steel.

UTILITY may require a stainless-steel strap and fusion epoxy or nylon coated ductile iron body with stainless steel hardware in areas designated as corrosive.

- 13.4.5 All services shall be sleeved with 2" schedule 40 PVC or greater under paved areas.

Division 3

Section 14

Water Main Installation, Disinfection and Pressure Testing

14.1 General

Pipe shall be installed in accordance with the manufacturer's specifications and instructions for the type of pipe used and applicable AWWA standards, such as C600 and C605, unless otherwise stated in these SPECIFICATIONS.

14.2 Pipe Handling

All types of pipe shall be handled in such manner as will prevent damage to the pipe or coating. Accidental damage to pipe or coating shall be repaired to the satisfaction of UTILITY or be removed from the job. When not being handled, the pipe shall be supported on timber cradles or on properly prepared ground, graded to eliminate all rock points and to provide uniform support along the full length. When being transported, the pipe shall be supported at all times in a manner which will not permit distortion or damage to the lining or coating. Any unit of pipe that, in the opinion of UTILITY, is damaged beyond repair by the CONTRACTOR shall be removed from the site of the work and replaced with another unit.

Joint gaskets shall be stored in clean, dark, dry location until immediately before use.

Dirt or other foreign material shall be prevented from entering the pipe or pipe joint during handling or laying operations and any pipe or fitting that has been installed with dirt or foreign material in it shall be removed, cleaned and reinstalled. At times when pipe installation is not in progress, the open ends of the pipe shall be closed by a watertight plug or by other means approved by UTILITY to ensure absolute cleanliness inside the pipe.

14.3 Separation of Water Mains and Sewers

14.3.1 General: Water mains that are installed in the vicinity of pipe lines designated to carry raw wastewater or reclaimed water (wastewater effluent) shall meet the horizontal and vertical separations specified below.

14.3.2 Horizontal Separation: A minimum horizontal separation of ten feet, outside of pipe to outside of pipe, shall be maintained between potable water piping and domestic wastewater gravity piping or storm water piping.

A minimum horizontal separation of ten feet, outside of pipe to outside of pipe, shall be maintained between potable water piping and reclaimed water piping carrying unrestricted public access reuse water.

Where it is not possible to maintain the required horizontal separation, the potable water

main may be laid in a separate trench or on an undisturbed earth shelf located on one side of the wastewater gravity piping, storm water piping or reclaimed water piping and at such an elevation that the bottom of the water main is at least eighteen inches above the top of the other pipe.

If the minimum allowable ten feet of horizontal separation or eighteen inches vertical separation in a separate trench cannot be maintained, the water pipe shall be ductile iron if the other pipe is a storm water pipe that may not be possibly upgraded in material and joint type.

If the minimum allowable ten feet of horizontal separation or eighteen inches vertical separation in a separate trench cannot be maintained, the water pipe and sanitary sewer pipe shall be ductile iron.

If the other pipe is a reclaimed water pipe and the above separation requirements are not met, the reclaimed water pipe shall be ductile iron.

Deviations from these requirements and other alternatives may be considered on a case-by-case basis if supported by data from the design engineer and must receive specific approval by the Department prior to implementation.

There shall be at least a 10-foot horizontal separation between potable water piping and sanitary sewer force mains without exception. Field conditions not allowing the minimum separation being achieved shall be reported to the engineer. Specific solutions to separation problems as proposed by the engineer must be accepted by the Department prior to implementation.

No water main shall pass through or come in contact with any part of a sanitary sewer manhole or storm sewer structure.

- 14.3.3 Vertical Separation: A minimum vertical separation of eighteen inches, outside of pipe to outside of pipe, shall be maintained between potable water piping, wastewater gravity piping, storm water piping or reclaimed water piping.

When there is less than eighteen inches of net vertical clearance between the potable water pipe and storm water pipe, the water piping shall be ductile iron. One full length of pipe shall be centered at the point of crossing.

If the minimum allowable ten feet of horizontal separation or eighteen inches vertical separation in a separate trench cannot be maintained, the water pipe and sanitary sewer pipe shall be ductile iron.

If the other pipe is a reclaimed water pipe and the above vertical separation requirements are not met, the reclaimed water pipe shall be ductile iron.

Special structural support or concrete saddles may be necessary at the pipe crossing location.

It is preferable to install the potable water pipe above the domestic wastewater, storm water or reclaimed water pipe at crossings.

Deviations from the separation requirements and other alternatives may be considered on a case-by-case basis if supported by data from the design engineer and must receive specific approval from the UTILITY and PWS prior to implementation.

There shall be a minimum of eighteen inches of net vertical separation between water mains and sanitary sewer force mains without exception. Situations where it is not possible to maintain the required vertical separation shall be reported to the engineer. Specific solutions as proposed by the engineer must be accepted by the UTILITY and PWS prior to implementation.

14.3.4 Crossing a Water Main over a Sewer: Whenever it is necessary for a water main to cross over a sewer, the water main shall be laid at such an elevation that the bottom of the water main is at least eighteen inches above the top of the sewer, unless local conditions or barriers prevent an eighteen inch vertical separation – in which case both the water main and sewer shall be constructed of ferrous materials and with joints that are equivalent to water main standards for a distance of ten feet on each side of crossing.

14.3.5 Crossing a Water Main under a Sewer: Whenever it is necessary for a water main to cross under a sewer, both the water main and the sewer shall be constructed of ferrous materials and with joints equivalent to water main standards for a distance of ten feet on each side of the point of crossing. A section of water main pipe shall be centered at the point of crossing.

14.4 Trench Preparation and Pipe Bending

14.4.1 Trench Preparation and Pipe Bedding: Applicable provisions of Division 3, Section 9 shall apply. Also refer to STANDARD DETAILS.

14.4.2 Pipe Preparation and Handling: All pipe and fittings shall be inspected prior to lowering into trench to insure no cracked, broken, or otherwise defective materials are being used. CONTRACTOR shall clean ends of pipe thoroughly and remove foreign matter and dirt from inside of pipe and keep clean during and after installation.

CONTRACTOR shall use proper implements, tools, and facilities for the safe and proper protection of the WORK. CONTRACTOR shall lower pipe into the trench in such a manner as to avoid any physical damage to the pipe and shall remove all damaged pipe from the job site. Care shall be taken not to drop or dump pipe into trenches under any circumstances.

14.4.3 Trench Dewatering and Drainage Control: Specifications from Division 3, Section 9 shall apply. CONTRACTOR shall prevent water from entering the trench during excavation and pipe installation operations to the extent required to properly grade the bottom of the trench and allow for proper compaction of the backfill. Pipe shall not be installed in water.

14.4.4 Survey Line and Grade: Pipe shall be installed to the lines and grades shown on the PLANS. The CONTRACTOR shall provide line and grade stakes at a 1,000-foot maximum spacing and at all line and/or grade change locations. CONTRACTOR shall provide Temporary Bench Marks at maximum 1,000-foot intervals. The minimum pipe depth shall be three (3) feet below the finished grade surface or three (3) feet below the elevation of the edge of the pavement of the road surface whichever is greater.

- 14.4.5 Pipe-laying in Trench: CONTRACTOR shall prevent foreign material from entering the pipe while it is being placed in the trench. CONTRACTOR shall remove all foreign material from the pipe or joint ring before the next pipe is placed. If the pipe-laying crew cannot put the pipe into the trench, and in place, without getting soil into the pipe, UTILITY may require that snugly-fitted, tightly-woven canvas bags be placed over each end before lowering the pipe. The bags shall be left in place until the connection is to be made to the adjacent pipe. During laying operations, CONTRACTOR shall keep debris, tools, clothing, or other materials out of the pipe.
- 14.4.6 Installing PVC Pipe: All PVC pipe shall be installed in accordance with standards set forth in the UNI-BELL "Handbook of PVC Pipe Design and Construction" unless such standards conflict with this MANUAL in which case this MANUAL shall apply.
- 14.4.7 Installing Ductile Iron Pipe: All ductile-iron pipe shall be installed in accordance with AWWA C600 unless such standards conflicts with this MANUAL in which case this MANUAL shall apply. CONTRACTOR shall cut pipe only as necessary to comply with alignment shown on the PLANS. Flame cutting of pipe shall not be allowed.
- CONTRACTOR shall provide special tools and devices, such as special jacks, chokers, and similar items required for proper installation. Lubricant for the pipe gaskets shall be furnished by the pipe manufacturer, and no substitutes shall be permitted under any circumstances.
- The pipe shall be polyethylene encased (8 mil) where shown on the DRAWINGS in accordance with ANSI/AWWA A21.51/C105.
- 14.4.8 Installing Pipes on Curves: Long radius curves, either horizontal or vertical, may be installed with standard pipe by deflections at the joints. Maximum deflections at pipe joints and laying radius for the various pipe lengths shall be as recommended by the pipe manufacturer.
- 14.4.9 Pipe Restraining: Requirements specified in Division 3, Section 11 shall apply.
- 14.4.10 Bedding and Backfill for Pipes: Requirements specified in Division 3, Section 9 shall apply.

14.5 Hydrostatic Tests

- 14.5.1 General: Hydrostatic tests shall consist of pressure test and leakage test. Hydrostatic tests shall be conducted on all newly installed pressure pipes, joints and valves including all service lines to the curb stops. Air testing of pressure pipes will not be permitted under any circumstance. Tests may be made on sections not exceeding 2,000 feet, when this procedure is acceptable to UTILITY. CONTRACTOR shall furnish all necessary equipment and material, make all taps, and furnish all closure pieces in the pipe as required. Equipment to be furnished by the CONTRACTOR shall include graduated containers, pressure gauges, hydraulic force pumps, and suitable hoses and piping. UTILITY will monitor and approve a satisfactory test.

When filling and/or flushing a new water line extension that is connected to an existing system, the valve between the two shall always stay closed. Filling and/or flushing shall

be accomplished through and adequately sized “jumper”. The jumper shall consist of a tap onto the existing water line, a valve, a Reduced Pressure Zone (RPZ) backflow preventer, a valve, and a tap into the new extension. Filling and flushing of the new water line shall be accomplished through this tap. At no time shall the RPZ be removed until written authorization has been received from the UTILITY. The operation of the valves shall be coordinated with the UTILITY.

ONCE THE NEW WATER LINE EXTENSION IS ACCEPTED BY THE UTILITY, ALL TEMPORARY TAPS, PIPING AND RPZs SHALL BE REMOVED 9TAPS CAN BE ABANDONED IN PLACE.

The CONTRACTOR may conduct hydrostatic tests after the trench has been partially backfilled with the joints left exposed for inspection for his informational purposes only. The hydrostatic tests for acceptance shall only be conducted after the trenches have been completely backfilled and compacted as specified. Where any section of pipe is provided with concrete thrust blocking, pressure test will not be made until at least five days have elapsed after the thrust blocking is installed.

The CONTRACTOR is to provide UTILITY 48 hour notice before any pressure testing is to begin.

- 14.5.2 Testing Criteria: All pipe sections to be pressure tested shall be subjected to a hydrostatic pressure of 150 psi. The duration of each pressure test shall be for a period of 2 hours. If during the test, the integrity of the tested line is in question, UTILITY may require a 6-hour pressure test. The basic provisions of AWWA C-600 and C-605/M23 shall be applicable.
- 14.5.3 Procedure for Pressure Test: Each section of pipe to be tested, as determined by UTILITY, shall be slowly filled with water and the specified test pressure shall be applied by means of a pump connected to the pipe in a satisfactory manner. Before applying the specified test pressure, all air shall be expelled from the pipe. To accomplish this, taps shall be made, and appropriate valves installed to ensure bleeding of all air from the main. If defective pipes, fittings, valves, or hydrants are discovered in consequence of this pressure test, all such items shall be removed and replaced by the CONTRACTOR with sound material and the test shall be repeated until satisfactory results are obtained. Provisions of AWWA C600 and C605/M23, where applicable, shall apply.
- 14.5.4 Procedure for Leakage Test: After completion of the pressure test, a leakage test shall be conducted to determine the quantity of water lost by leakage under the specified test pressure. Applicable provisions of AWWA C600 and C605/M23 shall apply.

Allowable leakage in gallons per hour for pipeline shall not be greater than that determined by the formula:

$$L = \frac{SD(P)^{1/2}}{148,000}$$

L = Allowable leakage in gallons per hour.

S = Length of pipe tested, in feet.

D = Nominal diameter of the pipe in inches.

P = Average test pressure during leakage test in pounds per square inch gauge.

Leakage is defined as the quantity of water to be supplied in the newly installed pipe or any valve section under test which is necessary to maintain the specified leakage test pressure after the pipe has been filled with water and the air expelled. Should any test of pipe installed disclose leakage greater than that allowed, CONTRACTOR shall locate and replace or repair the defective joints, pipe or valve until the leakage from subsequent testing is within the specified allowance.

In accordance with Division 1 Section 2, the engineer of record shall submit a certifying statement/report on the results of the testing with the Final Certification Package.

14.6 Disinfection of Water Mains

14.6.1 General: Before being placed in service, all new water mains shall be chlorinated in accordance with the specifications below and the procedures outlined in AWWA C651 "Standard Procedure for Disinfecting Water Mains." , section 4.4.3, the Continuous Feed Method, and section .1003 of *The Rules Governing Public Water Supply Systems*.

14.6.2 Flushing: Sections of pipe to be disinfected shall first be directionally flushed (full diameter) to remove any solids or contaminated material that may have become lodged in the pipe. If no hydrant is installed at the end of the main, then a blow-off valve shall be provided large enough to develop a velocity of at least 2.5 feet per second in the main.

A Disinfection plan must be presented to the UTILITY prior to disinfection/flushing. If additional valves and/or blow-offs/hydrants are required to achieve a directional flushing, they will be provided by the Contractor as part of the construction.

All taps required for chlorination or flushing purpose or for temporary or permanent release of air shall be provided for by the CONTRACTOR as a part of the construction of water mains. After the disinfection, all such taps shall be sealed to the satisfaction of UTILITY.

14.6.3 Disinfection Criteria: Before being placed into service, all new mains and repaired portions of, or extensions to existing mains shall be chlorinated so that the initial chlorine residual is not less than 50 mg/l.

14.6.4 Form of Applied Chlorine: Chlorine may be applied as liquid chlorine (gas-water mixture), or a mixture of water and high-test calcium hypochlorite. CONTRACTOR shall assume responsibility for safe handling of chlorine and shall meet requirements of OSHA and other regulatory agencies for safe handling of chlorine.

14.6.5 Point of Application: The preferred point of application of the chlorinating agent is at the beginning of the pipe line extension or any valved section of it, and through a corporation stop inserted in the pipe. The water injector for delivering the chlorine-bearing water into the pipe should be supplied from a tap made on the pressure side of the gate valve controlling the flow into the pipe line extension. Alternate points of applications may be used when approved or directed by UTILITY.

14.6.6 Operation of Aqua North Carolina Valves: Valves shall be manipulated by UTILITY personnel so that the strong chlorine solution in the line being treated will not flow back

into the line supplying the water.

- 14.6.7 Retention Period: Treated water shall be retained in the pipe at least 24 hours.
- 14.6.8 Chlorinating Valves and Hydrants: In the process of chlorinating newly installed pipe, all valves or other appurtenances shall be operated while the pipe line is filled with the chlorinating agent and under normal operating pressure.
- 14.6.9 Final Flushing and Testing: Following chlorination, all treated water shall be thoroughly flushed from the newly installed pipe at its extremity until the replacement water throughout its lengths shows upon test, a free chlorine residual not in excess of 1 ppm after flushing.

After flushing; water samples, as directed by UTILITY, shall show acceptable bacteriological results. All bacteriological testing shall be performed by a private laboratory. All such bacteriological analysis must be performed by a laboratory certified by the State of North Carolina.

Proper chain of custody procedures must be followed and samples shall only be collected by certified laboratory personnel in the presence of UTILITY'S personnel.

Copies of testing results and all related correspondence with the NCDENR shall be submitted to UTILITY.

- 14.6.10 Repetition of Flushing and Testing: Should the initial treatment result in an unsatisfactory bacterial test, the original chlorination procedure shall be repeated by the CONTRACTOR until satisfactory results are obtained. The water lines shall not be placed into service until bacteriological test results are found to be satisfactory by a state-approved laboratory.

14.7 Notification and Connection to Existing Mains

Requirements specified in Division 3, Section 12.3 shall apply.

14.8 Cross-Connection Control

- 14.8.1 Inspection and Testing: Backflow prevention assemblies shall be tested by a certified cross-connection control technician in the presence of a UTILITY representative.

All backflow prevention assemblies shall be inspected and approved by UTILITY prior to project acceptance and service being provided.

14.9 Water Service Piping and Connection

Water service piping and connection shall be installed as indicated in the STANDARD DETAILS. The location of all service lines shall be as shown on the DRAWINGS and shall be either single or dual service. On curbed streets, the exact location for each installed service shall be marked by etching or cutting a "W" in the concrete curb. Where no curb exists, locations shall be adequately marked by a method approved by UTILITY.

14.10 Location and Identification

All PVC water mains shall be a solid blue color. All water mains shall have an "Early Warning" protection tape installed continuously along the alignment. The protection tape shall be installed during backfilling 8 to 12 inches below finished grade directly over the pipe and be continuously marked "Caution, Water Main Buried Below." The tape shall have a metallic detectable strip included and be blue in color. All protection tape shall be as Terra-Tape or equal. See STANDARD DETAILS. In addition to the warning tape there shall be installed a 12 gage THNN location wire. Concurrent Ends of this location wire shall be physically connected utilizing a protective corrosion resistant connector as approved by the UTILITY.

All ductile iron water mains shall either be marked with a continuous 2-inch wide blue stripe located within the top 90 degrees of the pipe or wrapped in blue polyethylene bags. Backfill shall not be placed for 30 minutes following paint application.

Division 3

Section 15

Valves, Hydrants & Accessories

15.1 General

All valves and appurtenances shall be products of well established firms who are fully experienced and qualified in the manufacture of the particular equipment to be furnished. The equipment shall be designed, constructed and installed in accordance with the best practices and methods and shall comply with these SPECIFICATIONS as applicable.

15.2 Resilient Seat Gate Valves

15.2.1 General: All gate valves twenty-four (24) inches and smaller shall be resilient seat gate valves. All Valves with be clock-wise closed and counter clock-wise open Such valves shall be resilient seated, manufactured to meet or exceed the requirements of AWWA C509, latest revision, and in accordance with the following SPECIFICATIONS. Valves shall have an unobstructed waterway equal to or greater than the full nominal diameter of the pipe

15.2.2 Material: The valve body, bonnet, and bonnet cover shall be cast iron ASTM A126, Class B. All ferrous surfaces inside and outside shall have a fusion-bonded epoxy coating. A 2" wrench nut shall be provided for operating the valve in a buried installation. All valves shall be tested in strict accordance with AWWA C509. All valves are to open counterclockwise.

15.2.3 Miscellaneous Requirements: The valves shall be right hand open, non-rising stem with the stem made of cast, forged, or rolled bronze as specified in AWWA C509. Two stem seals shall be provided and shall be of the o-ring type. The stem nut must be independent of the gate.

The resilient sealing mechanism shall provide zero leakage at the water working pressure when installed with the line flow in either direction.

15.3 Butterfly Valves

15.3.1 General: All shut-off valves sixteen (16) inches and larger shall be butterfly valves. Butterfly valves and operators shall conform to the AWWA Standard Specifications for Rubber Seated Butterfly Valves, Designation C504, except as hereinafter specified. Valves, except as specified hereinafter, shall be Class 150A or B. All Valves with be clock-wise closed and counter clock-wise open

15.3.2 Material: The valve body shall be constructed of close grain cast iron per ASTM A126, Class B or equivalent material. All retaining segments and adjusting devices shall be of

corrosion resistant material. Valve seats shall be a natural rubber or synthetic rubber compound. Valve seats 30 inches and larger shall be field adjustable and replaceable without dismounting operator disc or shaft and without removing the valve from the line. All retaining segments and adjusting devices shall be of corrosion resistant material. Valves 24 inches and smaller shall have bonded or mechanically restrained seats as outlined in AWWA C504.

15.3.3 Face-to-Face Dimension: The face-to-face dimensions of valves shall be in accordance with above mentioned AWWA Specification for short-body valve.

15.3.4 Valve Shaft: The valve shaft shall be turned, ground, polished and constructed of 18-8 stainless steel and designed for both torsional and shearing stresses when the valve is operated under its greatest dynamic or seating torque. Shaft shall be of either a one-piece unit extending full size through the valve disc and valve bearing or it may be of a stub shaft design.

15.3.5 Valve Operator: In general, the butterfly valve operators shall conform to the requirements of AWWA Standard Specifications for Rubber Seated Butterfly Valves, Designation C504, insofar as applicable

15.4 Valve Installation

All valves shall be inspected upon delivery in the field to insure proper working order before installation. They shall be set and jointed to the pipe in the manner as set forth in the AWWA Standards for the type of connection ends furnished. All valves and appurtenances shall be installed true to alignment and rigidly supported. Any damage to the above items shall be repaired to the satisfaction of UTILITY before they are installed.

Valves shall be installed in a vertical position and be provided with a standard valve box so arranged that no shock will be transmitted to the valve. The box shall be vertically centered over the operating nut, and the cast iron box cover shall be set flush with the road bed or finished surface.

After installation, all valves shall be subjected to the field test for piping as outlined in Division 3, Section 14 of these SPECIFICATIONS. Should any defects in materials or workmanship appear during these tests, the CONTRACTOR shall correct such defects to the satisfaction of UTILITY.

Flanged joints shall be made with hot dipped galvanized bolts, nuts and washers. Mechanical joints shall be made with mild corrosion resistant alloy steel bolts and nuts. All exposed bolts shall be painted the same color as the pipe. All buried bolts and nuts shall be heavily coated with two (2) coats of bituminous paint

15.5 Valve Boxes

All buried valves shall have cast-iron three-piece valve boxes. Valve boxes shall be provided with suitable heavy bonnets and shall extend to such elevation at the finished grade surface as directed by UTILITY. The barrel shall be two-piece, sliding type, having 5-1/4 inch shaft. The upper section shall have a flange at the bottom having sufficient bearing area to prevent settling and shall be complete with cast iron covers. Covers shall have "WATER" cast into the top for all water mains. The actuating nuts for deeper valves shall be extended to come up to 4-foot depth below finished grade.

Care shall be taken while constructing valve boxes to ensure that valve stems are vertical and the cast iron box has been placed over the stem with base bearing on compacted fill and top flush with final grade. Boxes shall have sufficient bracing to maintain alignment during backfilling. CONTRACTOR shall remove any sand or undesirable fill from valve box prior to final inspection.

All valve boxes shall be equipped with concrete collar.

15.6 Air Release Valves

Air Release Valves shall be manufactured to meet or exceed the requirements of AWWA C512 as appropriate, latest revision, and in accordance with the following SPECIFICATIONS:

The air release valves for use in water mains shall be installed as shown on the STANDARD DETAILS. Valves used for 6 inch water lines and larger shall have a cast-iron body or bronze body, cover and baffle, stainless steel float, bronze water diffuser, Buna-N or Viton seat and stainless-steel trim. Valves used on water lines smaller than six inches shall have a cast iron body with a stainless-steel float and trim, Buna-N valve with a stainless steel seat. Valves shall be provided with a vacuum check to prevent air from re-entering the line. The fittings shall be threaded (NPT).

15.7 Hydrants

15.7.1 Material: Hydrants shall have a 5-1/4 inch valve opening and shall comply with AWWA Standard C502 for hydrants for water works service, unless in conflict with MANUAL, in which case this MANUAL shall apply. Each hydrant shall have 6-inch mechanical joint ends with harnessing lugs ("dog ears") and shall open by turning to the left (counter-clockwise). Hydrant shall be of ample length for 3-1/2 foot depth of bury. It shall be provided with two 2-1/2 inch hose nozzles and one 5 1/4 inch pumper nozzle, all having National Standard hose threads. Nozzles shall have caps attached by chains. Operating nuts shall be AWWA Standard (pentagonal, measuring 1-1/2 inch point to flat). Hydrants shall be equipped with "O-Ring" packing.

15.7.2 Painting: All iron parts of the hydrant both inside and outside shall be painted, in accordance with AWWA C502. All inside surfaces and the outside surfaces below the ground line shall be coated with asphalt varnish. They shall be covered with the two coats, the first having dried thoroughly before the second is applied

The outside of the hydrant above the furnished ground line shall be thoroughly cleaned and thereafter painted with one coat of paint of a durable composition.

15.7.3 Construction Details: Hydrants shall be plumb and shall be set so that the lowest hose connection is, at least, eighteen (18) inches above the surrounding finished grade. All hydrants shall be inspected in the field upon delivery to the job to insure proper operation before installation. The resetting of existing hydrants and moving and reconnecting of existing hydrants shall be handled in a manner similar to a new-installation. Hydrant shall be constructed in accordance with the STANDARD DETAILS.

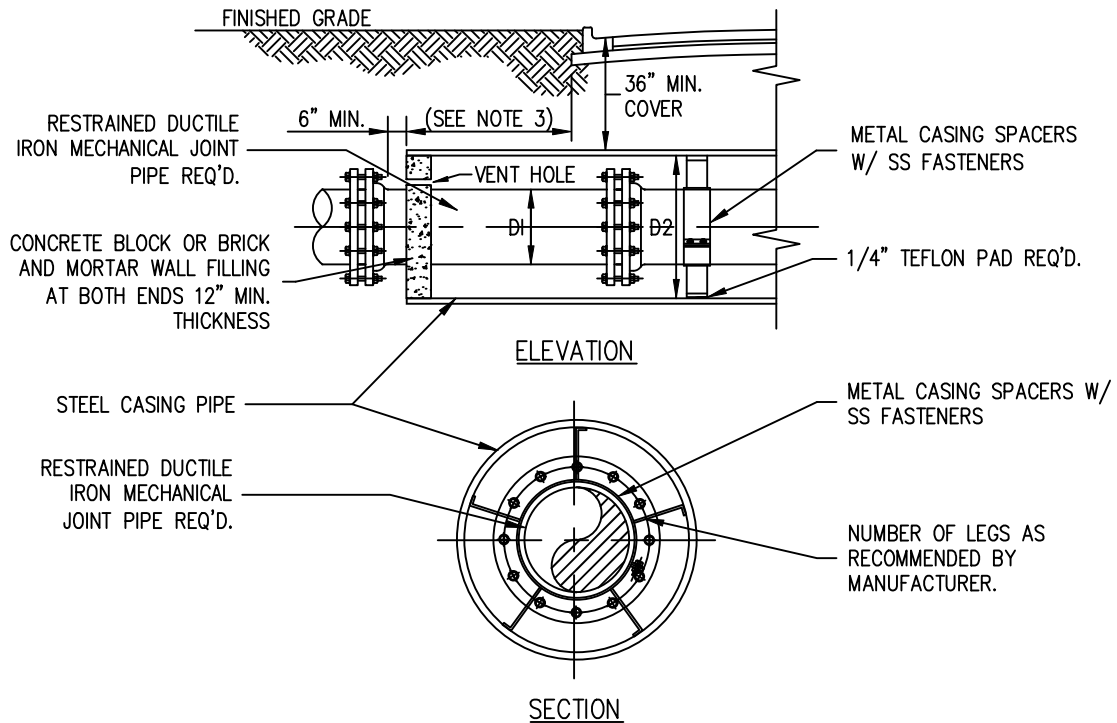

15.7.4 Location: Hydrants shall be located in the general location as shown on the DRAWINGS. All hydrants shall be located no less than five (5) and no more than ten (10) feet from the

edge of pavement of the adjacent roadway and no less than five (5) feet from any physical feature which may obstruct access or view of any hydrant, unless otherwise approved by the applicable county and UTILITY

AQUA

Aqua North Carolina, Inc.

NOTES:

1. CONTRACTOR TO SUBMIT CALCULATIONS APPROVED BY PIPE MANUFACTURER FOR DETERMINATION OF REQUIRED HDPE PIPE THICKNESS FOR EACH INSTALLATION.
2. "R" IS TO BE BASED ON 125% OF MANUFACTURER'S RECOMMENDED MINIMUM RADIUS.
3. WHEN CONSTRUCTION IS WITHIN THE NCDOT JURISDICTION, ADDITIONAL REQUIREMENTS OF THE ENCROACHMENT AGREEMENT SHALL BE MET.

ASPHALTIC CONCRETE SURFACES

PORTLAND CEMENT CONCRETE SURFACES

- NOTES:
1. ALL PUBLIC ROADS AND PAVED DRIVE CROSSINGS SHALL BE BACKFILLED WITH COMMON FILL MATERIAL AND TOPPED WITH AT LEAST 8" IN THICKNESS OF LIMEROCK BASE COURSE MATERIAL DURING CONSTRUCTION OF UTILITY TRENCH.
 2. IN LOCALS WHERE ABOVE DETAILS DEVIATE FROM COUNTY AND/OR CITY STANDARDS, THE CONTRACTOR SHALL PROVIDE ALL NECESSARY MATERIALS AND LABOR TO CONFORM TO SAID STANDARDS.
 3. ALL EXCAVATIONS SHALL COMPLY WITH ALL STATE LAWS AND LOCAL ORDINANCES, LATEST EDITION.
 4. TRACER WIRE AND DETECTABLE WARNING TAPE REQUIRED ON ALL SUBSURFACE UTILITY INSTALLATIONS.

9. NO WATER PIPE SHALL PASS THROUGH OR COME IN CONTACT WITH ANY PART OF A SANITARY SEWER MANHOLE OR STORM SEWER STRUCTURE.

*"REUSE WATER MAIN" SHALL BE BURIED TO 6' AT INTERSECTIONS OR WHERE CROSSING WITH POTABLE WATER LINE AND WILL MAINTAIN EIGHTEEN (18) INCH CLEARANCE

SANITARY GRAVITY, FORCE MAIN, REUSE MAIN, STORM SEWER, & POTABLE WATER MAIN SEPARATION NOTES & SOLUTIONS

1. A MINIMUM HORIZONTAL SEPARATION OF TEN (10) FEET OUTSIDE TO OUTSIDE SHALL BE MAINTAINED BETWEEN WATER MAINS AND SANITARY GRAVITY SEWER OR STORM SEWER LINES.
2. A MINIMUM HORIZONTAL SEPARATION OF THREE (3) FEET OUTSIDE TO OUTSIDE SHALL BE MAINTAINED BETWEEN WATER MAINS AND RECLAIMED WATER LINES CARRYING UNRESTRICTED PUBLIC ACCESS REUSE WATER.
3. IN AREAS WHERE IT IS NOT PRACTICAL TO MAINTAIN THE REQUIRED SEPARATION, THE WATER MAIN MUST BE LAID IN A SEPARATE TRENCH OR ON AN UNDISTURBED EARTH SHELVE LOCATED ON ONE SIDE OF THE SANITARY GRAVITY SEWER, STORM SEWER OR RECLAIMED WATER LINE AT SUCH AN ELEVATION THAT THE BOTTOM OF THE WATER MAIN IS AT LEAST EIGHTEEN (18) INCHES ABOVE THE TOP OF THE OTHER LINE.
4. IF THE MINIMUM ALLOWABLE TEN (10) FOOT HORIZONTAL SEPARATION OR EIGHTEEN (18) INCH VERTICAL SEPARATION IN A SEPARATE TRENCH CANNOT BE MAINTAINED, UPGRADE THE WATER MAIN TO DUCTILE IRON, IF THE OTHER LINE IS A STORM SEWER.
5. IF THE NON-CONFORMING LINE IS A GRAVITY SANITARY SEWER, AND TEN (10) FEET OF HORIZONTAL SEPARATION OR EIGHTEEN (18) INCHES VERTICAL SEPARATION IN A SEPARATE TRENCH CANNOT BE MAINTAINED, UPGRADE THE GRAVITY SANITARY SEWER (IF BEING NEWLY INSTALLED) TO AWWA C-900, D.R. 18 PVC AND HYDROSTATICALLY TEST IT TO 150psi.
6. IF THE OTHER LINE IS A RECLAIMED WATER LINE AND THE ABOVE SEPARATION REQUIREMENTS ARE NOT MET, UPGRADE THE RECLAIMED WATER LINE MATERIAL TO DUCTILE IRON.
7. DEVIATIONS AND OTHER ALTERNATIVES SHALL BE CONSIDERED ON CASE-BY-CASE BASIS AND MUST RECEIVE SPECIFIC APPROVAL BY NCDENR PRIOR TO IMPLEMENTATION.
8. THERE SHALL BE AT LEAST A TEN (10) FOOT SEPARATION BETWEEN WATER MAINS AND SANITARY SEWER FORCE MAINS WITHOUT EXCEPTION. FIELD PROBLEMS SHALL BE REPORTED TO NCDENR/ENGINEER. SPECIAL SOLUTIONS MUST BE ACCEPTED BY NCDENR PRIOR TO IMPLEMENTATION.
9. NO WATER PIPE SHALL PASS THROUGH OR COME IN CONTACT WITH ANY PART OF A SANITARY SEWER MANHOLE OR STORM SEWER STRUCTURE.
10. A MINIMUM OF VERTICAL SEPARATION OF EIGHTEEN (18) INCHES OUTSIDE TO OUTSIDE SHALL BE MAINTAINED BETWEEN WATER MAIN, SANITARY GRAVITY SEWER, STORM SEWER OR RECLAIMED WATER LINES.
11. WHEN THERE IS LESS THAN EIGHTEEN (18) INCHES VERTICAL CLEARANCE BETWEEN THE WATER MAIN AND STORM SEWER, THE WATER MAIN SHALL BE UPGRADED TO DUCTILE IRON. ONE FULL LENGTH OF PIPE SHALL BE LOCATED AT THE POINT OF CROSSING.
12. IF THE NON-CONFORMING IS A SANITARY GRAVITY SEWER WHERE THERE IS LESS THAN EIGHTEEN (18) INCHES VERTICAL CLEARANCE FROM THE WATER MAIN, UPGRADE THE SANITARY GRAVITY SEWER TO DIP PVC AND HYDROSTATICALLY TEST IT TO WATER MAIN STANDARDS. PIPES SHALL BE LOCATED SO THAT JOINTS ARE AS FAR AS POSSIBLE FROM EACH OTHER.
13. IF THE OTHER LINE IS A RECLAIMED WATER LINE AND THE ABOVE MINIMUM SEPARATION IS NOT MET, UPGRADE THE RECLAIMED WATER LINE MATERIAL TO DUCTILE IRON.
14. SPECIAL STRUCTURAL SUPPORT OR CONCRETE SADDLES MAY BE NECESSARY AT THE CROSSING LOCATION.
15. IT IS PREFERABLE TO LAY THE WATER MAIN ABOVE THE CROSSING HAZARD.

16. DEVIATIONS AND OTHER ALTERNATIVES SHALL BE CONSIDERED ON CASE-BY-CASE BASIS AND MUST RECEIVE SPECIFIC APPROVAL BY NCDENR PRIOR TO IMPLEMENTATION

17. THERE SHALL BE AN EIGHTEEN (18) INCH VERTICAL SEPARATION BETWEEN WATER MAINS AND SANITARY SEWER FORCE MAINS AT CROSSINGS WITHOUT EXCEPTION. CONFLICTS WITH EXISTING LINES, WHERE IT IS NOT POSSIBLE TO MAINTAIN THE REQUIRED SEPARATION, IT SHALL BE REPORTED TO AQUA NORTH CAROLINA, INC./ENGINEER. SPECIAL SOLUTIONS MUST BE ACCEPTED BY NCDENR PRIOR TO IMPLEMENTATION.

TYPICAL CONFLICT RESOLUTION BY DEFLECTION
SEE NOTES

- NOTES:**
- THIS DETAIL SHALL BE USED TO AVOID EXISTING UTILITIES THAT ARE SHOWN ON THE DRAWINGS.
 - PIPE DEFLECTION MUST NOT EXCEED MANUFACTURER'S RECOMMENDATION.

- NOTES:**
- THIS DETAIL SHALL BE USED UNDER THE FOLLOWING CONDITIONS:
 - WHERE IT IS SPECIFICALLY SHOWN ON THE DRAWINGS.
 - WHEN UTILITIES NOT SHOWN ON THE PLAN, ARE ENCOUNTERED.

RESTRAINED JOINTS, SEE RESTRAINED JOINT DETAIL

NOTE:

1. RESTRAINED JOINTS SHALL BE PROVIDED AT ALL BENDS, TEES AND DEAD ENDS AS INDICATED IN THESE TABLES, OR AS SHOWN ON THE DRAWINGS FOR OTHER SPECIFIC CONDITIONS. THE USE OF CONCRETE THRUST BLOCKING IS PROHIBITED, UNLESS OTHERWISE INDICATED ON THE DRAWINGS.
2. MAXIMUM LENGTHS OF PIPE SHALL BE USED WITHIN RESTRAINED SECTIONS.
3. LENGTH OF PIPE WITH RESTRAINED JOINTS IS BASED ON INSTALLATION IN SP SOILS. IF OTHER SOIL CONDITIONS ARE ENCOUNTERED, LENGTH OF RESTRAINED PIPE SHALL BE ADJUSTED ACCORDINGLY. ENGINEER SHALL SUPPLY CALCULATIONS TO AQUA NORTH CAROLINA, INC. FOR REVIEW.
4. PIPE TRENCH AND INSTALLATION SHALL BE DIPRA TYPE 4 AS SHOWN ON DETAILS SHEET.

NOTES:

- ALL MATERIALS SHALL BE IN ACCORDANCE WITH AQUA NORTH CAROLINA STANDARDS.
- TAPPING SLEEVES SHALL BE AS MANUFACTURED BY ROMAC, SMITH-BLAIR, OR APPROVED EQUAL.
- STAINLESS STEEL TAPPING SLEEVE MAY BE UTILIZED FOR ALL TAPPING OF MAINS UP TO AND INCLUDING 24" DIAMETER WITH 12" OR LESS BRANCH. BRANCH GREATER THAN 12" SHALL REQUIRE FULL BODY D.I. M.J. TAPPING SLEEVE, (SEE DETAIL W.9).
- SHELL AND LUGS SHALL BE STAINLESS STEEL PER ASTM A 240, TYPE 304 AND 304L.
- BOLTS SHALL BE 5/8" UNC ROLLED THREAD, STAINLESS STEEL PER ASTM A 193 TYPE 304 4" NOM. PIPE SIZE SHALL HAVE MIN. 1/2" BOLTS.
- NUTS SHALL BE HEAVY HEX STAINLESS STEEL PER ASTM A-194, TYPE 304.
- WASHERS SHALL BE STEEL AND PLASTIC LUBRICATING WASHER.
- GASKETS SHALL BE VIRGIN SBR PER ASTM D 2000 MAA 610, COMPOUNDED FOR WATER AND SEWER SERVICE.
- FLANGE SHALL BE DUCTILE IRON PER ASTM 536, GRADE 65-45-12; OR STAINLESS STEEL PER ASTM A-240, TYPE 304.
- DIMENSIONS SHOWN ARE FOR REFERENCE AND MAY VARY BASED UPON MANUFACTURER. SLEEVES SHALL BE SIMILAR IN NATURE TO THAT SHOWN AND SHALL NOT DEVIATE IN ESSENTIAL DETAILS.
- PIPE SURFACES SHALL BE CLEANED THOROUGHLY TO PERMIT A GOOD SEAL PRIOR TO INSTALLATION.
- ALL TAPPING SLEEVES SHALL BE HYDROSTATICALLY PRESSURE TESTED PRIOR TO THE TAP BEING ACCOMPLISHED. TEST SHALL BE APPROVED BY AQUA NORTH CAROLINA PROJECT COORDINATOR PRIOR TO BEGINNING TAPPING PROCESS.
- THE NUMBER OF BOLTS, NUTS AND WASHERS SHOWN ARE FOR ILLUSTRATION ONLY, ACTUAL QUANTITY SHALL BE AS RECOMMENDED BY THE SLEEVE MANUFACTURER FOR THE REQUIRED SERVICE.
- SEE TAPPING VALVE DETAIL (W.9) FOR ADDITIONAL INFORMATION.

AIR RELEASE VALVE DETAIL

AQUA

Aqua North Carolina, Inc.

NOTES:

1. WHERE ROCK OR NON-CUSHIONING MATERIAL IS ENCOUNTERED IN TRENCH, USE #5 STONE FOR A DEPTH OF 8" UNDER PIPE.
2. WHERE UNSUITABLE SOIL OR MUCK IS ENCOUNTERED, EXCAVATE THE SOIL AND BACKFILL WITH #5 STONE TO FORM A PIPE BED.
3. PVC AND DUCTILE IRON MAINS SHALL MEET ALL STANDARDS AS CALLED OUT IN THE SPECIFICATIONS (DIVISION 5, SECTION 1.3.3).
4. ALL WATER MAINS SHALL HAVE A DETECTABLE "EARLY WARNING" PROTECTION TAPE AND HDPE LOCATING WIRE INSTALLED CONTINUOUSLY ALONG THE ALIGNMENT. THE PROTECTION TAPE AND WIRE SHALL BE INSTALLED DURING BACKFILLED 6"-12" INCHES BELOW FINISHED GRADE DIRECTLY OVER THE PIPE AND BE CONTINUOUSLY MARKED "CAUTION, WATER MAIN BURIED BELOW." THE TAPE SHALL HAVE A METALLIC DETECTABLE STRIP INCLUDED AND BE GREEN IN COLOR. ALL PROTECTION TAPE SHALL BE AS TERRA-TAPE OR EQUAL.
5. ALL P.V.C. WATER MAINS SHALL BE EITHER A SOLID BLUE COLOR OR WHITE BLUE LETTERING. ALL LETTERING SHALL APPEAR ON THREE SIDES OF THE PIPE AND SHALL RUN THE ENTIRE LENGTH OF THE PIPE AND SHALL BE A MINIMUM 3/4 INCH IN HEIGHT WITH THE APPROPRIATE WORDING APPEARING ONE OR MORE TIMES EVERY 21 INCHES ALONG THE LENGTH OF THE PIPE. THE LETTERING MUST BE PERMANENTLY STENCILED TO THE PIPE SURFACE. LETTERING SHALL READ AS IS ACCEPTABLE FOR THE INTENDED USE. ALL LETTERING SHALL BE APPLIED BY THE PIPE MANUFACTURER DURING PRODUCTION.
6. ALL DUCTILE IRON WATER MAINS SHALL BE MARKED WITH A CONTINUOUS STRIPE LOCATED WITHIN THE 90° OF THE PIPE. SAID STRIPE SHALL BE A MINIMUM 2-INCHES IN WIDTH AND SHALL BE BLUE IN COLOR. BACKFILL SHALL NOT BE PLACED FOR 30 MINUTES FOLLOWING PAINT APPLICATION.
7. ALL P.V.C. PIPE SHALL BEAR THE NATIONAL SANITATION FOUNDATION (NSF) SEAL OF APPROVAL FOR POTABLE WATER PIPE.

STRUCTURAL GENERAL NOTES

GENERAL NOTES:

ALL DETAILS AND SECTIONS SHOWN ON THE DRAWINGS ARE INTENDED TO BE TYPICAL AND SHALL BE CONSTRUED TO APPLY TO ANY SIMILAR SITUATION ELSEWHERE ON THE PROJECT, EXCEPT WHERE A DIFFERENT DETAIL IS SHOWN.

MANUFACTURERS OF ANY PRE-ENGINEERED, PRE-FABRICATED SYSTEM OR COMPONENT SHALL SUBMIT SHOP DRAWINGS FOR THE ENGINEER/ARCHITECT'S APPROVAL PRIOR TO FABRICATION OR ERECTION OF SYSTEM/COMPONENT. THESE SHOP DRAWINGS SHALL BE SIGNED AND SEALED BY A NORTH CAROLINA REGISTERED ENGINEER.

FOUNDATIONS:

IT SHALL BE OWNER'S RESPONSIBILITY TO VERIFY SOIL BEARING CAPACITY AND SUB SURFACE CONDITIONS, PRIOR TO START OF CONSTRUCTION. OWNER'S GEOTECHNICAL CONSULTANT MAY RECOMMEND DIFFERENT SITE PREPARATION REQUIREMENTS THAN LISTED BELOW. CONTRACTOR SHALL COORDINATE SOIL INVESTIGATION FINDINGS AND SUBSEQUENT RECOMMENDATIONS WITH OWNER AND HIS GEOTECHNICAL CONSULTANT.

MAXIMUM ALLOWABLE SOIL PRESSURE IS ASSUMED TO BE 2000 POUNDS PER SQUARE FOOT.

SPREAD FOOTINGS SHALL BEAR ON SOIL COMPACTED TO A DENSITY OF AT LEAST 95% OF MODIFIED PROCTOR MAXIMUM DENSITY (A.S.T.M. D1557). THE SOIL SHALL BE COMPACTED TO THIS DENSITY TO A DEPTH OF AT LEAST TWO FEET BELOW THE BOTTOM OF THE FOOTINGS.

CONCRETE:

DESIGN OF REINFORCED CONCRETE CONFORMS WITH BUILDING CODE REQUIREMENTS FOR REINFORCED CONCRETE - ACI 318, LATEST EDITION.

CONCRETE SHALL HAVE AN UNCONFINED COMPRESSIVE STRENGTH OF 3000 PSI AT 28 DAYS.

CONCRETE PROTECTION FOR REINFORCING BARS SHALL BE AS FOLLOWS:

FOOTINGS 3" CLEAR, BOTTOM AND SIDES, 2" CLEAR, TOP WALLS 2" CLEAR, OUTSIDE FACE, 1-1/2" CLEAR, INSIDE FACE

DESIGN MIXES:
PROVIDE NORMAL WEIGHT CONCRETE WITH THE FOLLOWING PROPERTIES:

3000 PSI 28-DAY COMPRESSIVE STRENGTH, 480 LBS. TYPE I PORTLAND CEMENT PER CU.YD. MINIMUM, W/C RATIO, 0.58 MAXIMUM (NON-AIR ENTRAINED), 0.46 MAXIMUM AIR ENTRAINED. NO FLY ASH OR OTHER POZZOLAN IS PERMITTED. SLUMP LIMIT 3" TO 5".

REINFORCING STEEL:

ALL REINFORCING STEEL SHALL BE NEW BILLET STEEL CONFORMING TO A.S.T.M. A615-GRADE 60. ALL DETAILING AND ACCESSORIES SHALL CONFORM TO TYPICAL DETAILS SHOWN IN THE "MANUAL OF STANDARD PRACTICE FOR DETAILING REINFORCED CONCRETE STRUCTURES ACI 315, LATEST EDITION".

TANK:

PRE-FABRICATED TANK MANUFACTURER SHALL SUBMIT SHOP DRAWINGS FOR DESIGN ENGINEER'S REVIEW PRIOR TO FABRICATION. FOLLOW ALL FEDERAL, STATE, AND LOCAL CODES AND OTHER ORDINANCES PERTAINING TO THIS WORK. PROVIDE ALL PERTINENT DETAILS, MATERIAL STRENGTH, PHYSICAL PROPERTIES, ETC. AS APPLICABLE.

NOTE:
THE INTERIOR OF HYDRO-PNEUMATIC TANK SHALL BE CLEANED & EPOXY COATED IN ACCORDANCE WITH THE EPA AND NSF STANDARD 61 FOR POTABLE WATER SUPPLY SYSTEM COMPONENTS.

NOTES:

1. PROVIDE R-15 BATT INSULATION ON WALLS AND R-30 BATT INSULATION IN CEILING..
2. CEILING JOIST SHALL BE 8 FEET ABOVE FINISHED FLOOR.

DIVISION 5
LIST OF MATERIALS AND
APPROVED MANUFACTURERS

Division 5

Section 1

North Carolina

1.1 Well Sites

- 1.1 Grassing: Centipede grass seed mixed with “Contractus”.
- 1.2 Graveling: 4” thick, compacted, crush and run gravel.

1.2 Pumps and Motors

- 1.2.1 Submersible Motors: Motors shall be manufactured by Franklin or Centri-pro and of the highest psi thrust bearing available. Any other manufacturer must be approved by UTILITY.

- 1.2.2 Submersible Pumps

- 1.2.2.1 Goulds or Grundfos are acceptable; design shall be for the most efficiency.

- 1.2.2.2 1.5”, 2” & 3” sizes acceptable, larger sizes may be approved as required (Drop Pipe).

- 1.2.2.3 Strataflo, series 300, full port, NPT, spring check valve. Two (2) are required if setting is 300 plus feet deep.

- 1.2.3 Booster Pumps and Motors

- 1.2.3.1 Booster pumps shall be designed by, or approved, by Utility to meet 12hr demand with submersible pumping and storage capacity. The pumps and the tank(s) shall also meet Peak demand. All pumps shall be approved by Utility.

- 1.2.3.2 Booster Pumps of the series specified and shall be manufactured by either:

- Goulds
Low pressure up to 60psi, Centrifugal, Series “S”, “LH”, “M” or “L” close coupled, 230VAC, single or 3 phase, depending on circumstances.
High pressure over 60psi, Multi-stage, Series “SSV”, configuration SVB, SVD, or SVC, vertical , 230VAC, single or 3 phase, depending on circumstances.
In certain instances, as specified by the Utility, Variable speed pumps may be used and would be of the “Aquavar” series.

- Grundfos

Low pressure up to 60psi, Centrifugal, Series “SR” or SF, close coupled, 230VAC, single or 3 phase, depending on circumstances.

High pressure over 60psi, Multi-stage, Series “CR”, “CRI” or CRN with a flanged inlet and outlet configuration, 230VAC, single or 3 phase, depending on circumstances.

In certain instances, as specified by the Utility, Variable speed pumps may be used and would be of the “BoosterpaQ” system.

- 1.2.4 Control: Only dual pumps with alternating, lead-lag, bypass and step interlock and all necessary controls shall be installed.
- 1.2.5 Air release shall be Watts, 1/4” bronze model FV -4M1(Dayton 4A821).
- 1.2.6 Swing check valve (horizontal piping only): Nibco, Bronze, Industrial, NPT, WOG minimum 200psi.
Spring check valve (vertical piping only): Strataflo, series 300 spring.
- 1.2.7 Gate valve: Nibco, Bronze, Industrial, short stem, NPT, WOG 300psi, series T-133.
- 1.2.8 Ball valve (1/4”): Apollo, Bronze, NPT, series 70-100, WOG 600psi.
Gauge: liquid filled 100psi w 1/4” NPT stem - Campbell PG11T-1.
liquid filled 200psi w 1/4” NPT stem – Campbell PG13T-L

1.3 Plumbing

1.3.1 Valve Bank

1.3.1.1 Above ground pipe: galvanized steel, cast Brass or Stainless.

1.3.1.2 Below ground pipe: PVC, , Ductile Iron, Brass or Stainless.

1.3.1.3 Water Meter: Sensus Omni or Hersey MVR Pulsar Flow provided by UITLETY.

1.3.1.4 Wye Strainer: Watts, bronze, series 777 or 77s, WOG 400psi

Ball valve (1” up): Apollo series 77-100, Bronze, threaded , Full Port with WOG of 600psi.

Pipe (above ground): galvanized, brass or stainless steel with braided poly pipe to Strainer.

1.3.1.5 Rubatex insulation only.

1.3.1.6 1/4” ball valve: Apollo, bronze, series 70-100, WOG 600psi.

1.3.1.7 Gauges: liquid filled 100psi w 1/4” NPT stem - Campbell PG11T-1.

liquid filled 200psi w 1/4” NPT stem – Campbell PG13T-L.

1.3.1.8 Swing check valves (1” up): Nibco, Lead Free bronze, threaded with WOG 200psi.

Ball valves (1” up): Apollo series 77-100, Bronze, threaded , Full Port with

WOG of 600psi.

Gate valves: Nibco, Lead Free Bronze, non-rising stem, Series T-113 with WOG 300 psi

1.3.1.9 Pressure Switch: Allen Bradley, Model 836T-T253J.

Ball Valves: Apollo, bronze, series 70-100, WOG 600psi.

1.3.1.10 Hose bib:

Threaded: Nibco, Lead Free, bronze, NPT with WOG 200psi.

Non-threaded: Nibco, industrial, bronze, NPT with WOG 200psi.

1.3.1.11 Eyewash: Guardian, model G5026.

1.3.1.12 Distribution Pressure Relief Valve – 2 inch Kunkle Model 0020-H01-MG

Factory set at 100 psig – all bronze

1.3.2 Hydro Pneumatic tank

1.3.2.1 Dresser sleeve shall be MJ, cast type such as manufactured by UFCO or equal.

1.3.2.2 MJ valve: valves shall comply with AWWA C-500 and be iron body, parallel seat type, bronze fitted with resilient rubber coated wedge. Model # Kennedy 15TIX, Mueller A2360 or equivalent.

Valve Box: cast iron, adjustable screw type Part #.

Valve Box Ring: Brooks 24" valve collar.

1.3.2.3 MJ valve: valves shall comply with AWWA C-500 and be iron body, parallel seat type, bronze fitted with resilient rubber coated wedge. Model # Kennedy 15TIX, Mueller A2360 or equivalent.

1.3.2.4 Valve Box: cast iron, adjustable screw type, such as manufactured by UFCO or equal.

Valve Box Ring: Brooks 24" valve collar.

1.3.3 Distribution line:

1.3.3.1 SDR 21, Class 200 PVC, acceptable within subdivision up to 2" unless otherwise directed by UTILITY.

1.3.3.2 DR 14, C900 PVC, acceptable within subdivision, state, county or federal roads, under culverts and under creeks (when cased).

1.3.3.3 Class 50, Ductile Iron, minimum pressure rating 200psi, acceptable within subdivision, state, county or federal roads, under culverts and under creeks (when cased).

1.3.3.4 HDPE pipe of the specified size and pressure rating of not less than 200psi, shall be used under wetlands or stream crossings. Proper size and type fittings shall be installed. Once the pipe is installed, if direct bored, it shall have a waiting period of 7days, to allow for shrinkage before tying on to other pipe.

- 1.3.4 Restraint Fittings
 - 1.3.4.1 MJ fittings, where the restraining system is built in, such as AquaGrip, shall be acceptable on all types of pipe without further blocking.
 - 1.3.4.2 Megalug restraint collars systems shall not be allowed on SDR 21, Class 200 PVC. Types with minimum of 6 lugs, are acceptable on all other pipes listed under (5) above.
- 1.3.5 Relief Valve: bronze, NPT, ASTM and Boiler rated, steam rated, valve, set at the tested or approved tank pressure, Kunkle Valve, Model 6010eem01-km0(xxx) (psi).
- 1.3.6 Vacuum Breaker: Strataflo, series 300, inverted spring check valve with mushroom vent.
- 1.3.7 Locking Ball Valve: Apollo ball valve, model 75 -105 with 600 WOG rating and a four position locking device. All Valves with be clock-wise closed and counter clock-wise open
- 1.3.8 Air Compressor
 - 1.3.8.1 Whitewater, Model 1/6hp, 120VAC.
 - 1.3.8.2 Probes and pressure switch Included with (1).
- 1.3.9 Chemical Barrels: Pulsafeeder chemical barrel (55 gal).

1.4 Distribution mains

- 1.4.1 Mains
 - 1.4.1.1 same as Distribution Line.
 - 1.4.1.2 same as Restraint Fittings.
 - 1.4.1.3 Other Fittings: Tees, bend, etc. MJ cast (Mueller or equal) or compression (as made by "One Bolt, Inc.").
 - 1.4.1.4 MJ Gate Valves (Square nut): Kennedy 15TIX, Mueller A-2360 or equivalent.
 - 1.4.1.5 Valve Box: cast iron, adjustable screw type, such as manufactured by UFCO or equal.
 - 1.4.1.6 Valve Box Ring: Brooks 24" valve collar.
 - 1.4.1.7 Air Relief Valve: automatic blow-off – For 6 inch and large water lines, the air relief valve shall be APCO #200, Crispin PL 20 (2inch) or equivalent. For water lines smaller than 6 inch the air relief valve shall be the Crispin AR10 (1 inch), APCO #50 (1 inch), or equivalent.
 - 1.4.1.8 Mains: Last 400' on cul-de-sacs – minimum size 4".

1.4.2 Services

1.4.2.1 Meter Box: NDS D1200 meter box with hinge lid.

1.4.2.2 Meter setter: Ford Model VHH-72-7W or Mueller 1404-2 Yoke or

1.4.2.3 Strap Saddles: Bronze, double strap made by Mueller, Ford or Equal.

1.4.2.4 Compression Fittings: Mueller, Ford or equal.

1.4.2.5 Chaseways: schedule 40, PVC, electrical conduit or plumbing pipe.

1.4.2.6 Meters: Provided by UTILITY.

1.4.2.7 All service lines shall be ¾" 1", 1-1/2" or 2" blue polyethylene tubing conforming to specifications in AWWA C800 and AWWA . One and one-half inch (1-1/2") and larger shall be sized in accordance with the Iron Pipe Sizing Standard (IPS); ¾ " and 1" shall be the Copper Tube Sizing Standard (CTS)

1.4.3 Backflow and Cross Connection

1.4.3.1 Backflow Prevention Device:

Severe Hazard: Bronze RPZ – Cla-Val-RP2, Watts Series 009QT, Wilkins WK975XL-075, Febco 825Y (D), Conbraco 400, or approved equal

Moderate Hazard: Bronze, Double Check Valve Assembly, part # 40-104-997

1.4.4 Hydrants

1.4.4.1 Kennedy K81-D2 5 1/4", Mueller Centurion A421 5 1/4", or utility-approved equal.

1.5 Water Treatment

1.5.1 Chemical Equipment.

1.5.1.1 Chemical Pump: Pulsafeeder, model LE Series of appropriate pressure and flow design requirements, or as specified by UTILITY.

14gpd @ 100psi: LEK3SA-VHC-xxx

24gpd @ 100psi: LE14SA-VHC-xxx

6gpd @ 150psi: LE2SA-VHC-xxx

22gpd @ 150psi: LEK34SA-VHC-xxx

1.5.1.2 Chemical Vat: NSF Approved- Snyder or approved equivalent

1.5.1.3 Safety Components

Flow Switch, Low Flow (below 15gpm): ITT, McDonnell & Miller Model FS7-4.

Flow Switch, Full Flow (over 15gpm): ITT, McDonnell & Miller Model FS4-3.

1.6 Tanks

1.6.1 Hydro Pneumatic Tanks

1.6.1.1 Tank shall be National Board stamped ASME approved, as manufactured by RECO USA or Ramco Tank Manufacturers. Other tank manufacturers to submit plans for approval to UTILITY before construction on the tank begin.

1.6.1.2 Pedestals shall be poured with 12” dip for tank and a minimum of 3/8” thick rubber shall be installed between the tank and the pedestal.

1.6.2 Ground Storage Tanks

1.6.2.1 Probes shall be manufactured by WARRICK CONTROLS and of the configuration specified by Utility.

1.7 Well House

1.7.1 Building

1.7.1.1 Door: 36” minimum single door, steel of (min) 16 Gauge, painted with Epoxy Paint or a semi solid or solid fiberglass door.

1.7.1.2 Automatic Foundation Vents: 8”x16”.
Closing Vents: 8”x 16”, part #.

1.8 Electrical

1.8.1 Panels

1.8.1.1 Panel 230VAC, ITE, with copper busway.
Nema 4X Inside and Outside
Part Number Single Phase
Part Number Three Phase

1.8.2 Magnetic Starters

1.8.2.1 Starter: Allen Bradley, Nema 3R, , three pole with 120VAC coil.

1.8.2.2 Timer: Intermatic Model FF5M spring wound 5-minute timer (also works for hand switch).

1.8.2.3 Auxiliary Contacts: Two Normally open required

1.8.2.4 Thermal Overloads: Allen Bradley – series “J”.

1.8.3 Pressure Switch: Allen Bradley – 835T-T253J or Square D

1.8.4 Indicating Controls

1.8.4.1 Elapsed Time Meter: Vender-Root 7795.

1.8.4.2 Impulse Counter: Durant 6-Y-41345.

1.8.5 Telemetry / Radio Controls

1.8.5.1 Telemetry: provided by UTILITY.

1.8.5.2 Radio Control: provided by UTILITY.

1.8.6 Air Compressor: Whitewater, Model 1/6hp, 120vac, Model # 1HAB-44-M100X 115 volt 1/6HP 0.12 KW 60 Hz, or McDonnell & Miller Tank Level Controller.

1.8.7 Heating

1.8.7.1 Base Board Heater:

4': 1,000-watt, 240 volts AC, part # Dayton 3UG84D.

1.8.7.2 Remote Thermostat: White-Rodgers, Model #2B61-186.

1.8.8 Auto-Off Timers: Intermatic FF Series, Commercial Series.

APPENDIX B

Lateral Relocation Release Form

Project: _____

Contractor: _____

I, _____ property owner of _____

(address), requested my proposed sewer/water lateral location be relocated from sta.

_____ to sta. _____. I _____ release and hold harmless,

_____ (contractor), The City of Fayetteville, the Public Works Commission,

and _____ (engineering firm) any and all liability stemming from the above

agreement.

APPENDIX C

Public Works Commission

Fayetteville, North Carolina

PROPERTY DAMAGE CLAIM FORM

This form is provided as a means for an individual to seek reimbursement from the Public Works Commission of the City of Fayetteville, North Carolina for property damage of an individual or guardian filing this claim. The Fayetteville Public Works Commission is governed by the General Statutes of North Carolina.

Please read and follow instructions below:

1. Fill in all parts of the form. If there are any section(s) that do not apply to your claim, please indicate by placing N/A in the space.
2. Cost estimates must be bona fide estimates for repair or replacement of all damage items listed on this form.
3. Food items should be listed individually on a separate paper and a cost or replacement cost be provided.
4. Total the combined items at the end of the list and transfer that total and all other totals to the Amount of Claim line on the requisition page.
5. Original cost estimates, pictures, or documents should be attached to the completed claim form. (No photocopies will be accepted.)
6. Sign and date the claim form.
7. Return completed form to: Water Resources Engineering Department/Annex
C/O Public Works Commission
P.O. Box 1089
Fayetteville, N.C. 28302-1089

Last Name: _____ First Name: _____

Business Name (if applicable): _____

Street: _____ City: _____ State: _____ Zip: _____

Home Telephone #: () _____ Work Telephone #: () _____

Email Address (if you would like to be contacted by email): _____

Date of Incident: _____ Time of Incident: _____

Location of Incident: _____

List and describe all damaged property: (Attach additional sheets if necessary)

Owner: *(If different than claimant)*

Name: _____ Daytime Telephone #: () _____

Address: _____

If this property is covered by Insurance Company, list information below:

Insurance Agent: _____ Telephone #: () _____

Insurance Company: _____

Address: _____ State: _____ Zip Code: _____

Policy Number: _____ Expiration Date: _____

VEHICLE DESCRIPTION:

Make and Model: _____ Year: _____

Police Report Number (If available): _____

Give a brief description of what happened: *(Attach additional sheets if necessary)*

Witness(s):

Name: _____ Phone: () _____

Address: _____

AMOUNT OF CLAIM: \$ _____

I acknowledge that all statements provided in this Claim for Damage form is true and that I have signed and dated this statement for authenticity of documents and information.

Claimant Signature: _____

Date: _____

Any questions regarding this claim should be directed to the Water Resources Engineering at (910) 223-4730. The Public Works Commission reserves the right to question any cost estimate(s) prior to acceptance of a claim.

BEFORE MAILING MAKE SURE ALL ESTIMATES AND/OR LISTS ARE ATTACHED

SUMMARY

Fleming & Associates, PA was retained by W. K. Dickson & Co., Inc. to perform a limited visual structural inspection of foundation walls and exteriors of structures potentially affected by the **City of Fayetteville Annexation Phase V Area 27 Annexation**. The structures inspected were determined by W. K. Dickson & Co., Inc.

The inspections were conducted on January 25, 2024. A total of ten (10) structures were inspected. Fleming & Associates, PA visually inspected the exterior elevations and noted pre-existing deficiencies. The deficiencies are documented in the following report.

Should any further inspections or assistance be required, please let us know.

APPENDIX E

FEDERAL REGULATIONS GOVERNING CONTRACT

PROTEST PROCEDURES

Protests related to this procurement must be addressed to the Public Works Commission Purchasing Office, 955 Old Wilmington Road, Fayetteville, NC 28301 and shall be received, in writing, within 5 calendar days of bid award. Responses will be supplied not later than (7) calendar days following receipt of said protest. A protester must exhaust all administrative remedies before pursuing a protest with the Federal grantor agency. Reviews of protests by the Federal grantor agency are limited to:

- (1) Violations of federal law or regulations and the standard of this section (violations of state or local law will be under the jurisdiction of state and local authorities) AND
- (2) Violations of the grantee's (PWC/City of Fayetteville) protest procedures for failure to review a complaint or protest. Protests received by the Federal grantor agency other than those specified above will be referred to the grantee.

LOBBYING

31 U.S.C. 1352
49 CFR Part 19
49 CFR Part 20

Byrd Anti-Lobbying Amendment, 31 U.S.C. 1352, as amended by the Lobbying Disclosure Act of 1995, P.L. 104-65 [to be codified at 2 U.S.C. § 1601, et seq.]

Contractors who apply or bid for an award of \$100,000 or more shall file the certification required by 49 CFR part 20, "New Restrictions on Lobbying." Each tier certifies to the tier above that it will not and has not used Federal appropriated funds to pay any person or organization for influencing or attempting to influence an officer or employee of any agency, a member of Congress, officer or employee of Congress, or an employee of a member of Congress in connection with obtaining any Federal contract, grant or any other award covered by 31 U.S.C. 1352. Each tier shall also disclose the name of any registrant under the Lobbying Disclosure Act of 1995 who has made lobbying contacts on its behalf with non-Federal funds with respect to that Federal contract, grant or award covered by 31 U.S.C. 1352. Such disclosures are forwarded from tier to tier up to the recipient.

CLEAN AIR

42 U.S.C. 7401 et seq
40 CFR 15.61
49 CFR Part 18

The Contractor agrees to comply with all applicable standards, orders or regulations issued pursuant to the Clean Air Act, as amended, 42 U.S.C. §§ 7401 et seq. The Contractor agrees to report each violation to the Commission and understands and agrees that the Commission will, in turn, report each violation as required to assure notification to the appropriate Federal agency and the appropriate EPA Regional Office.

The Contractor also agrees to include these requirements in each subcontract exceeding \$100,000 financed in whole or in part with Federal assistance.

ACCESS TO RECORDS AND REPORTS

49 U.S.C. 5325
18 CFR 18.36 (i)
49 CFR 633.17

The following access to records requirements apply to this Contract:

Where the Purchaser is not a State but a local government and is the Federal Recipient or a subgrantee of the Federal Recipient in accordance with 49 C. F. R. 18.36(i), the Contractor agrees to provide the Purchaser, the Federal grantor agency, the Comptroller General of the United States or any of their authorized representatives access to any books, documents, papers and records of the Contractor which are directly pertinent to this contract for the purposes of making audits, examinations, excerpts and transcriptions. Contractor also agrees, pursuant to 49 C. F. R. 633.17 to provide the Federal grantor agency or his authorized representatives including any PMO Contractor access to Contractor's records and construction sites pertaining to a major capital project, defined at 49 U.S.C. 5302(a)1, which is receiving federal financial assistance through the programs described at 49 U.S.C. 5307, 5309 or 5311.

Where any Purchaser which is the Federal grant recipient or a subgrantee of the Federal grant recipient in accordance with 49 U.S.C. 5325(a) enters into a contract for a capital project or improvement (defined at 49 U.S.C. 5302(a)1) through other than competitive bidding, the Contractor shall make available records related to the contract to the Purchaser, the Federal grantor agency and the Comptroller General or any authorized officer or employee of any of them for the purposes of conducting an audit and inspection.

The Contractor agrees to permit any of the foregoing parties to reproduce by any means whatsoever or to copy excerpts and transcriptions as reasonably needed.

The Contractor agrees to maintain all books, records, accounts and reports required under this contract for a period of not less than three years after the date of termination or expiration of this contract, except in the event of litigation or settlement of claims arising from the performance of this contract, in which case Contractor agrees to maintain same until the Purchaser, the Federal grantor agency, the Comptroller General, or any of their duly authorized representatives, have disposed of all such litigation, appeals, claims or exceptions related thereto. Reference 49 CFR 18.39(i)(11).

DAVIS-BACON AND COPELAND ANTI-KICKBACK ACTS

(1) **Minimum wages** - (i) All laborers and mechanics employed or working upon the site of the work (or under the United States Housing Act of 1937 or under the Housing Act of 1949 in the construction or development of the project), will be paid unconditionally and not less often than once a week, and without subsequent deduction or rebate on any account (except such payroll deductions as are permitted by regulations issued by the Secretary of Labor under the Copeland Act (29 CFR part 3)), the full amount of wages and bona fide fringe benefits (or cash equivalents thereof) due at time of payment computed at rates not less than those contained in the wage determination of the Secretary of Labor which is attached hereto and made a part hereof, regardless of any contractual relationship which may be alleged to exist between the contractor and such laborers and mechanics.

Contributions made or costs reasonably anticipated for bona fide fringe benefits under section 1(b)(2) of the Davis-Bacon Act on behalf of laborers or mechanics are considered wages paid to such laborers or mechanics, subject to the provisions of paragraph (1)(iv) of this section; also, regular contributions made or costs incurred for more than a weekly period (but not less often than quarterly) under plans, funds, or programs which cover the particular weekly period, are deemed to be constructively made or incurred during such weekly period. Such laborers and mechanics shall be paid the appropriate wage rate and fringe benefits on the wage determination for the classification of work actually performed, without regard to skill, except as provided in 29 CFR Part 5.5(a)(4). Laborers or mechanics performing work in more than one classification may be compensated at the rate specified for each classification for the time actually worked therein: Provided, That the employer's payroll records accurately set forth the time spent in each classification in which work is performed. The wage determination (including any additional classifications and wage rates conformed under paragraph (1)(ii) of this section) and the Davis-Bacon poster (WH-1321) shall be posted at all times by the contractor and its subcontractors at the site of the work in a prominent and accessible place where it can be easily seen by the workers.

(ii)(A) The contracting officer shall require that any class of laborers or mechanics, including helpers, which is not listed in the wage determination and which is to be employed under the contract shall be classified in conformance with the wage determination. The contracting officer shall approve an additional classification and wage rate and fringe benefits therefore only when the following criteria have been met:

(1) Except with respect to helpers as defined as 29 CFR 5.2(n)(4), the work to be performed by the classification requested is not performed by a classification in the wage determination; and

(2) The classification is utilized in the area by the construction industry; and

(3) The proposed wage rate, including any bona fide fringe benefits, bears a reasonable relationship to the wage rates contained in the wage determination; and

(4) With respect to helpers as defined in 29 CFR 5.2(n)(4), such a classification prevails in the area in which the work is performed.

(B) If the contractor and the laborers and mechanics to be employed in the classification (if known), or their representatives, and the contracting officer agree on the classification and wage rate (including the amount designated for fringe benefits where appropriate), a report of the action taken shall be sent by the contracting officer to the Administrator of the Wage and Hour Division, Employment Standards Administration, U.S. Department of Labor, Washington, DC 20210. The Administrator, or an authorized representative, will approve, modify, or disapprove every additional classification action within 30 days of receipt and so advise the contracting officer or will notify the contracting officer within the 30-day period that additional time is necessary.

(C) In the event the contractor, the laborers or mechanics to be employed in the classification or their representatives, and the contracting officer do not agree on the proposed classification and wage rate (including the amount designated for fringe benefits, where appropriate), the contracting officer shall refer the questions, including the views of all interested parties and the recommendation of the contracting officer, to the Administrator for determination. The Administrator, or an authorized representative, will issue a determination within 30 days of receipt and so advise the contracting officer or will notify the contracting officer within the 30-day period that additional time is necessary.

(D) The wage rate (including fringe benefits where appropriate) determined pursuant to paragraphs (a)(1)(ii) (B) or (C) of this section, shall be paid to all workers performing work in the classification under this contract from the first day on which work is performed in the classification.

(iii) Whenever the minimum wage rate prescribed in the contract for a class of laborers or mechanics includes a fringe benefit which is not expressed as an hourly rate, the contractor shall either pay the benefit as stated in the wage determination or shall pay another bona fide fringe benefit or an hourly cash equivalent thereof.

(iv) If the contractor does not make payments to a trustee or other third person, the contractor may consider as part of the wages of any laborer or mechanic the amount of any costs reasonably anticipated in providing bona fide fringe benefits under a plan or program, Provided, That the Secretary of Labor has found, upon the written request of the contractor, that the applicable standards of the Davis-Bacon Act have been met. The Secretary of Labor may require the contractor to set aside in a separate account assets for the meeting of obligations under the plan or program.

(v)(A) The contracting officer shall require that any class of laborers or mechanics which is not listed in the wage determination and which is to be employed under the contract shall be classified in conformance with the wage determination. The contracting officer shall approve an additional classification and wage rate and fringe benefits; therefore, only when the following criteria have been met:

(1) The work to be performed by the classification requested is not performed by a classification in the wage determination; and

(2) The classification is utilized in the area by the construction industry; and

(3) The proposed wage rate, including any bona fide fringe benefits, bears a reasonable relationship to the wage rates contained in the wage determination.

(B) If the contractor and the laborers and mechanics to be employed in the classification (if known), or their representatives, and the contracting officer agree on the classification and wage rate (including the amount designated for fringe benefits where appropriate), a report of the action taken shall be sent by the contracting officer to the Administrator of the Wage and Hour Division, Employment Standards Administration, Washington, DC 20210. The Administrator, or an authorized representative, will approve, modify, or disapprove every additional classification action within 30 days of receipt and so advise the contracting officer or will notify the contracting officer within the 30-day period that additional time is necessary.

(C) In the event the contractor, the laborers or mechanics to be employed in the classification or their representatives, and the contracting officer do not agree on the proposed classification and wage rate (including the amount designated for fringe benefits, where appropriate), the contracting officer shall refer the questions, including the views of all interested parties and the recommendation of the contracting officer, to the Administrator for determination. The Administrator, or an authorized representative, will issue a determination within 30 days of receipt and so advise the contracting officer or will notify the contracting officer within the 30-day period that additional time is necessary.

(D) The wage rate (including fringe benefits where appropriate) determined pursuant to paragraphs (a)(1)(v) (B) or (C) of this section, shall be paid to all workers performing work in the classification under this contract from the first day on which work is performed in the classification.

(2) **Withholding** – The City shall upon its own action or upon written request of an authorized representative of the Department of Labor withhold or cause to be withheld from the contractor under this contract or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to Davis-Bacon prevailing wage requirements, which is held by the same prime contractor, so much of the accrued payments or advances as may be considered necessary to pay laborers and mechanics, including apprentices, trainees, and helpers, employed by the contractor or any subcontractor the full amount of wages required by the contract. In the event of failure to pay any laborer or mechanic, including any apprentice, trainee, or helper, employed or working on the site of the work (or under the United States Housing Act of 1937 or under the Housing Act of 1949 in the construction or development of the project), all or part of the wages required by the contract, the City may, after written notice to the contractor, sponsor, applicant, or owner, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds until such violations have ceased.

(3) **Payrolls and basic records** - (i) Payrolls and basic records relating thereto shall be maintained by the contractor during the course of the work and preserved for a period of three years thereafter for all laborers and mechanics working at the site of the work (or under the United States Housing Act of 1937, or under the Housing Act of 1949, in the construction or development of the project). Such records shall contain the name, address, and social security number of each such worker, his or her correct classification, hourly rates of wages paid (including rates of contributions or costs anticipated for bona fide fringe benefits or cash equivalents thereof of the types described in section 1(b)(2)(B) of the Davis-Bacon Act), daily and weekly number of hours worked, deductions made and actual wages paid.

Whenever the Secretary of Labor has found under 29 CFR 5.5(a)(1)(iv) that the wages of any laborer or mechanic include the amount of any costs reasonably anticipated in providing benefits under a plan or program described in section 1(b)(2)(B) of the Davis-Bacon Act, the contractor shall maintain records which show that the commitment to provide such benefits is enforceable, that the plan or program is financially responsible, and that the plan or program has been communicated in writing to the laborers or mechanics affected, and records which show the costs anticipated or the actual cost incurred in providing such benefits. Contractors employing apprentices or trainees under approved programs shall maintain written evidence of the registration of apprenticeship programs and certification of trainee programs, the registration of the apprentices and trainees, and the ratios and wage rates prescribed in the applicable programs.

(ii)(A) The contractor shall submit weekly for each week in which any contract work is performed a copy of all payrolls to the City for transmission to the Federal Transit Administration. The payrolls submitted shall set out accurately and completely all of the information required to be maintained under section 5.5(a)(3)(i) of Regulations, 29 CFR part 5. This information may be submitted in any form desired. Optional Form WH-347 is available for this purpose and may be purchased from the Superintendent of Documents (Federal Stock Number 029-005-00014-1), U.S. Government Printing Office, Washington, DC 20402. The prime contractor is responsible for the submission of copies of payrolls by all subcontractors.

(B) Each payroll submitted shall be accompanied by a "Statement of Compliance," signed by the contractor or subcontractor or his or her agent who pays or supervises the payment of the persons employed under the contract and shall certify the following:

(1) That the payroll for the payroll period contains the information required to be maintained under section 5.5(a)(3)(i) of Regulations, 29 CFR part 5 and that such information is correct and complete;

(2) That each laborer or mechanic (including each helper, apprentice, and trainee) employed on the contract during the payroll period has been paid the full weekly wages earned, without rebate, either directly or indirectly, and that no deductions have been made either directly or indirectly from the full wages earned, other than permissible deductions as set forth in Regulations, 29 CFR part 3;

(3) That each laborer or mechanic has been paid not less than the applicable wage rates and fringe benefits or cash equivalents for the classification of work performed, as specified in the applicable wage determination incorporated into the contract.

(C) The weekly submission of a properly executed certification set forth on the reverse side of Optional Form WH-347 shall satisfy the requirement for submission of the "Statement of Compliance" required by paragraph (a)(3)(ii)(B) of this section.

(D) The falsification of any of the above certifications may subject the contractor or subcontractor to civil or criminal prosecution under section 1001 of title 18 and section 231 of title 31 of the United States Code.

(iii) The contractor or subcontractor shall make the records required under paragraph (a)(3)(i) of this section available for inspection, copying, or transcription by authorized representatives of the Federal Transit Administration or the Department of Labor, and shall permit such representatives to interview employees during working hours on the job. If the contractor or subcontractor fails to submit the required records or to make them available, the Federal agency may, after written notice to the contractor, sponsor, applicant, or owner, take such action as may be necessary to cause the suspension of any further payment, advance, or guarantee of funds. Furthermore, failure to submit the required records upon request or to make such records available may be grounds for debarment action pursuant to 29 CFR 5.12.

(4) Apprentices and trainees - (i) Apprentices - Apprentices will be permitted to work at less than the predetermined rate for the work they performed when they are employed pursuant to and individually registered in a bona fide apprenticeship program registered with the U.S. Department of Labor, Employment and Training Administration, Bureau of Apprenticeship and Training, or with a State Apprenticeship Agency recognized by the Bureau, or if a person is employed in his or her first 90 days of probationary employment as an apprentice in such an apprenticeship program, who is not individually registered in the program, but who has been certified by the Bureau of Apprenticeship and Training or a State Apprenticeship Agency (where appropriate) to be eligible for probationary employment as an apprentice. The allowable ratio of apprentices to journeymen on the job site in any craft classification shall not be greater than the ratio permitted to the contractor as to the entire work force under the registered program. Any worker listed on a payroll at an apprentice wage rate, who is not registered or otherwise employed as stated above, shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any apprentice performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. Where a contractor is performing construction on a project in a locality other than that in which its program is registered, the ratios and wage rates (expressed in percentages of the journeyman's hourly rate) specified in the contractor's or subcontractor's registered program shall be observed. Every apprentice must be paid at not less than the rate specified in the registered program for the apprentice's level of progress, expressed as a percentage of the journeymen hourly rate specified in the applicable wage determination. Apprentices shall be paid fringe benefits in accordance with the provisions of the apprenticeship program. If the apprenticeship program does not specify fringe benefits, apprentices must be paid the full amount of fringe benefits listed on the wage determination for the applicable classification. If the Administrator of the Wage and Hour Division of the U.S. Department of Labor determines that a different practice prevails for the applicable apprentice classification, fringes shall be paid in accordance with that determination. In the event the Bureau of Apprenticeship and Training, or a State Apprenticeship Agency recognized by the Bureau, withdraws approval of an apprenticeship program, the contractor will no longer be permitted to utilize apprentices at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(ii) Trainees - Except as provided in 29 CFR 5.16, trainees will not be permitted to work at less than the predetermined rate for the work performed unless they are employed pursuant to and individually registered in a program which has received prior approval, evidenced by formal certification by the U.S. Department of Labor, Employment and Training Administration. The ratio of trainees to journeymen on the job site shall not be greater than permitted under the plan approved by the Employment and Training Administration. Every trainee must be paid at not less than the rate specified in the approved program for the trainee's level of progress, expressed as a percentage of the journeyman hourly rate specified in the applicable wage determination. Trainees shall be paid fringe benefits in accordance with the provisions of the trainee program. If the trainee program does not mention fringe benefits, trainees shall be paid the full amount of fringe benefits listed on the wage determination unless the Administrator of the Wage and Hour Division determines that there is an apprenticeship program associated with the corresponding journeyman wage rate on the wage determination which provides for less than full fringe benefits for apprentices. Any employee listed on the payroll at a trainee rate who is not registered and participating in a training plan approved by the Employment and Training Administration shall be paid not less than the applicable wage rate on the wage determination for the classification of work actually performed. In addition, any trainee performing work on the job site in excess of the ratio permitted under the registered program shall be paid not less than the applicable wage rate on the wage determination for the work actually performed. In the event the Employment and Training Administration withdraws approval of a training program, the contractor will no longer be permitted to utilize trainees at less than the applicable predetermined rate for the work performed until an acceptable program is approved.

(iii) Equal employment opportunity - The utilization of apprentices, trainees and journeymen under this part shall be in conformity with the equal employment opportunity requirements of Executive Order 11246, as amended, and 29 CFR part 30.

(5) **Compliance with Copeland Act requirements** - The contractor shall comply with the requirements of 29 CFR part 3, which are incorporated by reference in this contract.

(6) **Subcontracts** - The contractor or subcontractor shall insert in any subcontracts the clauses contained in 29 CFR 5.5(a)(1) through (10) and such other clauses as the Federal Transit Administration may by appropriate instructions require, and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for the compliance by any subcontractor or lower tier subcontractor with all the contract clauses in 29 CFR 5.5.

(7) **Contract termination: debarment** - A breach of the contract clauses in 29 CFR 5.5 may be grounds for termination of the contract, and for debarment as a contractor and a subcontractor as provided in 29 CFR 5.12.

(8) **Compliance with Davis-Bacon and Related Act requirements** - All rulings and interpretations of the Davis-Bacon and Related Acts contained in 29 CFR parts 1, 3, and 5 are herein incorporated by reference in this contract.

(9) Disputes concerning labor standards - Disputes arising out of the labor standards provisions of this contract shall not be subject to the general disputes clause of this contract. Such disputes shall be resolved in accordance with the procedures of the Department of Labor set forth in 29 CFR parts 5, 6, and 7. Disputes within the meaning of this clause include disputes between the contractor (or any of its subcontractors) and the contracting agency, the U.S. Department of Labor, or the employees or their representatives.

(10) Certification of eligibility - (i) By entering into this contract, the contractor certifies that neither it (nor he or she) nor any person or firm who has an interest in the contractor's firm is a person or firm ineligible to be awarded Government contracts by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

(ii) No part of this contract shall be subcontracted to any person or firm ineligible for award of a Government contract by virtue of section 3(a) of the Davis-Bacon Act or 29 CFR 5.12(a)(1).

(iii) The penalty for making false statements is prescribed in the U.S. Criminal Code.

INCORPORATION OF FEDERAL TRANSIT ADMINISTRATION (FTA) TERMS

FTA Circular 4220.1E

The preceding provisions include, in part, certain Standard Terms and Conditions required by the Federal Government, whether or not expressly set forth in the preceding contract provisions. Anything to the contrary herein notwithstanding, all Federally mandated terms shall be deemed to control in the event of a conflict with other provisions contained in this Agreement. The Contractor shall not perform any act, fail to perform any act, or refuse to comply with any Grantor or Commission requests which would cause the Contractor to be in violation of the federal terms and conditions.

GOVERNMENT-WIDE DEBARMENT AND SUSPENSION (NONPROCUREMENT)

49 CFR Part 29
Executive Order 12549

Suspension and Debarment

This contract is a covered transaction for purposes of 49 CFR Part 29. As such, the contractor is required to verify that none of the contractor, its principals, as defined at 49 CFR 29.995, or affiliates, as defined at 49 CFR 29.905, are excluded or disqualified as defined at 49 CFR 29.940 and 29.945.

The contractor is required to comply with 49 CFR 29, Subpart C and must include the requirement to comply with 49 CFR 29, Subpart C in any lower tier covered transaction it enters into.

By signing and submitting its bid or proposal, the bidder or proposer certifies as follows:

The certification in this clause is a material representation of fact relied upon by the City. If it is later determined that the bidder or proposer knowingly rendered an erroneous certification, in addition to remedies available to the City, the Federal Government may pursue available remedies, including but not limited to suspension and/or debarment. The bidder or proposer agrees to comply with the requirements of 49 CFR 29, Subpart C while this offer is valid and throughout the period of any contract that may arise from this offer. The bidder or proposer further agrees to include a provision requiring such compliance in its lower tier covered transactions.

FEDERAL CHANGES

49 CFR Part 18

Contractor shall at all times comply with all applicable Federal regulations, policies, procedures and directives, including without limitation those listed directly or by reference in the Master Agreement between the Commission and the Federal grantor agency, as they may be amended or promulgated from time to time during the term of this contract. Contractor's failure to so comply shall constitute a material breach of this contract.

NO GOVERNMENT OBLIGATION TO THIRD PARTIES

No Obligation by the Federal Government.

(1) The Purchaser and Contractor acknowledge and agree that, notwithstanding any concurrence by the Federal Government in or approval of the solicitation or award of the underlying contract, absent the express written consent by the Federal Government, the Federal Government is not a party to this contract and shall not be subject to any obligations or liabilities to the Purchaser, Contractor, or any other party (whether or not a party to that contract) pertaining to any matter resulting from the underlying contract.

(2) The Contractor agrees to include the above clause in each subcontract financed in whole or in part with Federal assistance. It is further agreed that the clause shall not be modified, except to identify the subcontractor who will be subject to its provisions.

**PROGRAM FRAUD AND FALSE OR FRAUDULENT STATEMENTS
AND RELATED ACTS**

31 U.S.C. 3801 et seq.
49 CFR Part 31 18 U.S.C. 1001
49 U.S.C. 5307

(1) The Contractor acknowledges that the provisions of the Program Fraud Civil Remedies Act of 1986, as amended, 31 U.S.C. § 3801 et seq. and U.S. DOT regulations, "Program Fraud Civil Remedies," 49 C.F.R. Part 31, apply to its actions pertaining to this Project. Upon execution of the underlying contract, the Contractor certifies or affirms the truthfulness and accuracy of any statement it has made, it makes, it may make, or causes to be made, pertaining to the underlying contract or the Federal assisted project for which this contract work is being performed. In addition to other penalties that may be applicable, the Contractor further acknowledges that if it makes, or causes to be made, a false, fictitious, or fraudulent claim, statement, submission, or certification, the Federal Government reserves the right to impose the penalties of the Program Fraud Civil Remedies Act of 1986 on the Contractor to the extent the Federal Government deems appropriate.

(2) The Contractor also acknowledges that if it makes, or causes to be made, a false, fictitious, or fraudulent claim, statement, submission, or certification to the Federal Government under a contract connected with a project that is financed in whole or in part with Federal assistance, the Government reserves the right to impose the penalties of 18 U.S.C. § 1001 and 49 U.S.C. § 5307(n)(1) on the Contractor, to the extent the Federal Government deems appropriate.

(3) The Contractor agrees to include the above two clauses in each subcontract financed in whole or in part with Federal assistance. It is further agreed that the clauses shall not be modified, except to identify the subcontractor who will be subject to the provisions.

CIVIL RIGHTS REQUIREMENTS

29 U.S.C. § 623, 42 U.S.C. § 2000
42 U.S.C. § 6102, 42 U.S.C. § 12112
42 U.S.C. § 12132, 49 U.S.C. § 5332
29 CFR Part 1630, 41 CFR Parts 60 et seq.

Civil Rights - The following requirements apply to the underlying contract:

(1) Nondiscrimination - In accordance with Title VI of the Civil Rights Act, as amended, 42 U.S.C. § 2000d, section 303 of the Age Discrimination Act of 1975, as amended, 42 U.S.C. § 6102, section 202 of the Americans with Disabilities Act of 1990, 42 U.S.C. § 12132, and Federal transit law at 49 U.S.C. § 5332, the Contractor agrees that it will not discriminate against any employee or applicant for employment because of race, color, creed, national origin, sex, age, or disability. In addition, the Contractor agrees to comply with applicable Federal implementing regulations and other implementing requirements the Federal grantor agency may issue.

(2) Equal Employment Opportunity - The following equal employment opportunity requirements apply to the underlying contract:

(a) Race, Color, Creed, National Origin, Sex - In accordance with Title VII of the Civil Rights Act, as amended, 42 U.S.C. § 2000e, and Federal transit laws at 49 U.S.C. § 5332, the Contractor agrees to comply with all applicable equal employment opportunity requirements of U.S. Department of Labor (U.S. DOL) regulations, "Office of Federal Contract Compliance Programs, Equal Employment Opportunity, Department of Labor," 41 C.F.R. Parts 60 et seq., (which implement Executive Order No. 11246, "Equal Employment Opportunity," as amended by Executive Order No. 11375, "Amending Executive Order 11246 Relating to Equal Employment Opportunity," 42 U.S.C. § 2000e note), and with any applicable Federal statutes, executive orders, regulations, and Federal policies that may in the future affect construction activities undertaken in the course of the Project. The Contractor agrees to take affirmative action to ensure that applicants are employed, and that employees are treated during employment, without regard to their race, color, creed, national origin, sex, or age. Such action shall include, but not be limited to, the following: employment, upgrading, demotion or transfer, recruitment or recruitment advertising, layoff or termination; rates of pay or other forms of compensation; and selection for training, including apprenticeship. In addition, the Contractor agrees to comply with any implementing requirements the Federal grantor agency may issue.

(b) Age - In accordance with section 4 of the Age Discrimination in Employment Act of 1967, as amended, 29 U.S.C. § 623 and Federal transit law at 49 U.S.C. § 5332, the Contractor agrees to refrain from discrimination against present and prospective employees for reason of age. In addition, the Contractor agrees to comply with any implementing requirements the Federal grantor agency may issue.

(c) Disabilities - In accordance with section 102 of the Americans with Disabilities Act, as amended, 42 U.S.C. § 12112, the Contractor agrees that it will comply with the requirements of U.S. Equal Employment Opportunity Commission, "Regulations to Implement the Equal Employment Provisions of the Americans with Disabilities Act," 29 C.F.R. Part 1630, pertaining to employment of persons with disabilities. In addition, the Contractor agrees to comply with any implementing requirements the Federal grantor agency may issue.

(3) The Contractor also agrees to include these requirements in each subcontract financed in whole or in part with Federal assistance, modified only if necessary to identify the affected parties.

VALUE ENGINEERING CHANGE PROPOSALS (POST AWARD)

Contractors are hereby notified that value engineering will be used to pursue reasonable opportunities for cost reductions during project construction. Contractors are encouraged to develop, prepare and submit value engineering change proposals voluntarily.

TERMINATION FOR CAUSE AND CONVENIENCE

The performance of the work under this contract may be terminated by the Public Works Commission/City of Fayetteville in accordance with this clause in whole, or from time to time, or in part, whenever the Contracting Officer shall determine that such termination is in the best interest of the procuring agency. Any such termination shall be effected by delivery to the Contractor of a notice of termination specifying the extent to which performance of work under the contract is terminated, and the date upon which such termination becomes effective.

After receipt of a notice of termination and except otherwise directed by the Contracting Officer, the Contractor shall: stop work under the contract on the date and to the extent specified in the notice of termination; place no further orders or subcontracts for materials, services, or facilities, except as may be necessary for completion of such portion of the work under the contract as is not terminated; terminate all orders and subcontracts to the extent that they relate to the performance of work terminated by the notice of termination; assign to the procuring agency in the manner, at the time, and to the extent directed by the Contracting Officer, all of the right, title, and interest of the Contractor under the orders and subcontracts so terminated, in which case the procuring agency shall have the right, in its discretion, to settle or pay any or all claims arising out of the termination of such orders and subcontracts, with the approval or ratification of the Contracting Officer, to the extent he may require, which approval or ratification shall be final for all the purposes of this clause; transfer title to the Procuring Agency and deliver in the manner, at the times, and to the extent, if any, directed by the Contracting Officer the fabricated or un-fabricated parts, work in process, completed work, supplies, connections, and other material produced as a part of, or acquired in connection with the performance of, the work terminated, and completed or partially completed plans, drawings, information and other property which, if the contract had been completed, would have been required to be furnished to the Procuring Agency; use its best efforts to sell, in the manner, at the times, to the extent, and at the price(s) directed or authorized by the Contracting Officer, any property of the types referred to above, provided, however, that the Contractor shall not be required to extend credit to any purchases, and may acquire any such property under the conditions prescribed by and at a price(s) approved by the Contracting Officer, and provided further, that the proceeds of any such

transfer or dispositions shall be applied in reduction of any payments to be made by the Procuring Agency to the Contractor under this contract or shall otherwise be credited to the price or cost of the work covered by this contract or paid in such other manner as the Contracting Officer may direct; complete performance of such part of the work as shall not have been terminated by the notice of termination; and take such action as may be necessary, or as the Contracting Officer may direct, for the protection or preservation of the property related to this contract which is in the possession of the Contractor and in which the Procuring Agency has or may acquire an interest.

Settlement of claims by the Contractor under this termination for convenience clause shall be in accordance with the provisions set forth in Federal Procurement Regulations (FPR) 1-8, 701(c), (d), (e), (f), (g), (h), (i), (j) and (k), except that wherever the word "government" appears it shall be deleted and the word "Procuring Agency" shall be substituted in lieu thereof.

CONTRACT WORK HOURS AND SAFETY STANDARDS

(1) **Overtime requirements** - No contractor or subcontractor contracting for any part of the contract work which may require or involve the employment of laborers or mechanics shall require or permit any such laborer or mechanic in any workweek in which he or she is employed on such work to work in excess of forty hours in such workweek unless such laborer or mechanic receives compensation at a rate not less than one and one-half times the basic rate of pay for all hours worked in excess of forty hours in such workweek.

(2) **Violation; liability for unpaid wages; liquidated damages** - In the event of any violation of the clause set forth in paragraph (1) of this section the contractor and any subcontractor responsible therefor shall be liable for the unpaid wages. In addition, such contractor and subcontractor shall be liable to the United States for liquidated damages. Such liquidated damages shall be computed with respect to each individual laborer or mechanic, including watchmen and guards, employed in violation of the clause set forth in paragraph (1) of this section, in the sum of \$10 for each calendar day on which such individual was required or permitted to work in excess of the standard workweek of forty hours without payment of the overtime wages required by the clause set forth in paragraph (1) of this section.

(3) **Withholding for unpaid wages and liquidated damages** - The (write in the name of the grantee) shall upon its own action or upon written request of an authorized representative of the Department of Labor withhold or cause to be withheld, from any moneys payable on account of work performed by the contractor or subcontractor under any such contract or any other Federal contract with the same prime contractor, or any other federally-assisted contract subject to the Contract Work Hours and Safety Standards Act, which is held by the same prime contractor, such sums as may be determined to be necessary to satisfy any liabilities of such contractor or subcontractor for unpaid wages and liquidated damages as provided in the clause set forth in paragraph (2) of this section.

(4) **Subcontracts** - The contractor or subcontractor shall insert in any subcontracts the clauses set forth in paragraphs (1) through (4) of this section and also a clause requiring the subcontractors to include these clauses in any lower tier subcontracts. The prime contractor shall be responsible for compliance by any subcontractor or lower tier subcontractor with the clauses set forth in paragraphs (1) through (4) of this section.

BUY AMERICA REQUIREMENTS

49 U.S.C. 5323(j)

49 CFR Part 661

Buy America - The contractor agrees to comply with 49 U.S.C. 5323(j) and 49 C.F.R. Part 661, which provide that Federal funds may not be obligated unless steel, iron, and manufactured products used in Federally funded projects are produced in the United States, unless a waiver has been granted by the Federal grantor agency or the product is subject to a general waiver. General waivers are listed in 49 C.F.R. 661.7, and include final assembly in the United States for 15 passenger vans and 15 passenger wagons produced by Chrysler Corporation, and microcomputer equipment and software. Separate requirements for rolling stock are set out at 49 U.S.C. 5323(j)(2)(C) and 49 C.F.R. 661.11. Rolling stock must be assembled in the United States and have a 60 percent domestic content.

A bidder or offeror must submit to the Federal recipient the appropriate Buy America certification (below) with all bids or offers on federally funded contracts, except those subject to a general waiver. Bids or offers that are not accompanied by a completed Buy America certification must be rejected as nonresponsive. This requirement does not apply to lower tier subcontractors.

Certification requirement for procurement of steel, iron, or manufactured products.

Certificate of Compliance with 49 U.S.C. 5323(j)(1)

The bidder or offeror hereby certifies that it will meet the requirements of 49 U.S.C. 5323(j)(1) and the applicable regulations in 49 CFR Part 661.5.

Date _____

ENERGY CONSERVATION REQUIREMENTS

**42 U.S.C. 6321 et seq.
49 CFR Part 18**

The Contractor agrees to comply with mandatory standards and policies relating to energy efficiency which are contained in the state energy conservation plan issued in compliance with the Energy Policy and Conservation Act.

CLEAN WATER REQUIREMENTS

33 U.S.C. 1251

(1) The Contractor agrees to comply with all applicable standards, orders or regulations issued pursuant to the Federal Water Pollution Control Act, as amended, 33 U.S.C. 1251 et seq. The Contractor agrees to report each violation to the Commission and understands and agrees that the Commission will, in turn, report each violation as required to assure notification to the appropriate federal agency and the appropriate EPA Regional Office.

(2) The Contractor also agrees to include these requirements in each subcontract exceeding \$100,000 financed in whole or in part with Federal assistance.

RECYCLED PRODUCTS

**42 U.S.C. 6962
40 CFR Part 247
Executive Order 12873**

The contractor agrees to comply with all the requirements of Section 6002 of the Resource Conservation and Recovery Act (RCRA), as amended (42 U.S.C. 6962), including but not limited to the regulatory provisions of 40 CFR Part 247, and Executive Order 12873, as they apply to the procurement of the items designated in Subpart B of 40 CFR Part 247.

BONDING REQUIREMENTS

For Bonding requirements, refer to the Commission's bonding requirements for bid guaranty, performance bond and payment bond, including the required bond forms, found in the contract bid documents.

COMPLIANCE WITH FEDERALLY REQUIRED CLAUSES AND REQUIREMENTS

Contractor (bidder) is responsible for ensuring its compliance with all applicable Federal requirements. Additionally, Contractor is responsible for ensuring that subcontractors, at as many tiers of the Project as required, perform in accordance with the terms, conditions and specifications of the contract, including all applicable Federal requirements. Upon request of the City of Fayetteville or the Federal government, Contractor shall provide evidence of the steps it has taken to ensure its compliance with the Federal requirements, as well as evidence of the steps it has taken to ensure subcontractor performance, and/or submit evidence of subcontractor's compliance, at all tiers.

AMERICANS WITH DISABILITIES ACT (ADA)

Americans with Disabilities Act (ADA). The Contractor agrees to comply with all applicable requirements of the Americans with Disabilities Act of 1990 (ADA), as amended, 42 USC § 12101 *et seq.*; section 504 of the Rehabilitation Act of 1973, as amended, 29 USC § 794; 49 USC § 5301(d); and any implementing requirements the Federal Government. These regulations provide that no handicapped individual, solely by reason of his or her handicap, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity included in or resulting from this Agreement.

PRIVACY ACT

5 U.S.C. 552

(1) The Contractor agrees to comply with, and assures the compliance of its employees with, the information restrictions and other applicable requirements of the Privacy Act of 1974,

5 U.S.C. § 552a. Among other things, the Contractor agrees to obtain the express consent of the Federal Government before the Contractor or its employees operate a system of records on behalf of the Federal Government. The Contractor understands that the requirements of the Privacy Act, including the civil and criminal penalties for violation of that Act, apply to those individuals involved, and that failure to comply with the terms of the Privacy Act may result in termination of the underlying contract.

(2) The Contractor also agrees to include these requirements in each subcontract to administer any system of records on behalf of the Federal Government financed in whole or in part with Federal assistance.

APPENDIX F

REPORT OF SUBSURFACE EXPLORATION
AND GEOTECHNICAL EVALUATION
PHASE V AREA 27 ANNEXATION
FAYETTEVILLE, NC
BUILDING & EARTH PROJECT No.: **RD210446**

PREPARED FOR:
W.K. Dickson & Co., Inc.

AUGUST 25, 2021

Geotechnical, Environmental, and Materials Engineers

Attention: Mr. Monroe Huckaby, EI

Subject: Report of Subsurface Exploration and Geotechnical Evaluation
Phase V Area 27 Annexation
Fayetteville, North Carolina
Building & Earth Project No: RD210446

Mr. Huckaby:

Building & Earth Sciences, Inc. has completed an authorized subsurface exploration and geotechnical engineering evaluation for the Phase V Area 27 Annexation project in the Cliffdale Forest Subdivision. The subdivision is located north of the Cliffdale Road – South Raeford Road intersection in Fayetteville, NC.

The purpose of this exploration and evaluation has been to assess general subsurface conditions at the site and to address applicable geotechnical aspects of the project. Recommendations in this report are based on a physical reconnaissance of the site and observation and classification of subsurface samples collected from 18 standard penetration test soil borings and 2 dynamic cone penetrometer (DCP) hand auger borings. Confirmation of subsurface conditions reported herein during construction is an essential part of geotechnical services.

We appreciate the opportunity to provide consultation services in support of this project. If you have any questions regarding the information in this report or need any additional information, please call us.

Respectfully Submitted,

BUILDING & EARTH SCIENCES, LLP.

APPENDIX

1.0 PROJECT & SITE DESCRIPTION

Located in the Cliffdale Forest Subdivision of western Fayetteville, NC the perimeter of the site encompasses Phase V Area 27, a fraction of a larger Fayetteville PWC Annexation project. New sewer mains are planned with installation via traditional bore and jack and some aerial crossing. Land features include a creek which runs through the north end of the site, and elevations ranging from approximately 180 to 130 feet MSL. Further information regarding the proposed development is tabulated below. Photographs depicting the current site conditions are presented following the table.

Development Item	Detail	Description
General Site	Size (Ac.)	± 135 acres
	Existing Development	Residential Neighborhood
	Vegetation	Grass, trees, shrubs
	Slopes	Gently rolling terrain
	Retaining Walls	No
	Drainage	Well-Drained

Table 1: Project and Site Description

Figure 2: Flume Leading into Creek

2.0 SCOPE OF SERVICES

Subsurface exploration was performed during the period July 13 to July 15, 2021, in conformance with our proposal RD22126, dated February 18, 2020. Occasionally, some modification to work scopes appearing in our proposals is required to provide for proper evaluation of encountered subsurface conditions. Of the two (2) DCP/hand auger borings, one boring (B-06) was terminated at a depth of 7 feet below the existing ground surface due to washout.

The purpose of the geotechnical exploration has been to generally characterize subsurface conditions at specific boring locations and to gather data on which to base a geotechnical evaluation with respect to the proposed work. Subsurface exploration for this project consisted of 18 SPT soil borings and 2 DCP/hand auger borings. Three SPT borings extended to 25 ft. depths, and the remaining 15 extended to 20 ft. depths. Both DCP/hand auger borings were planned to extend to 8 feet; however 1 boring was terminated at 7 feet due to washout. SPT borings were drilled using a CME 75 truck rig equipped with a manual hammer.

Soil boring locations were field located by a representative of our staff using a handheld Garmin GPS. As such, the boring locations shown on the Boring Location Plan attached to this report should be considered approximate.

Soil samples recovered during our site investigation were visually classified and specific samples were selected by the project engineer for laboratory analysis. The laboratory analyses consisted of:

Test	ASTM	No. of Tests
Natural Moisture Content	D2216	29
Atterberg Limits	D4318	13
Particle Size Distribution of Soils (Gradation)	D6913	13
Standard Proctor Compaction Test	D698	6
Ductile Iron Pipe Research Association Testing	DIPRA	12

Table 2: Scope of Laboratory Tests

Results of the laboratory analyses are presented on the attached boring logs and in tabular form in the report Appendix. Descriptions of laboratory tests that were performed for this study are also included in the Appendix. Results of the work performed are presented in this report, and provide or address the following:

- Summary of existing surface conditions.
- A description of the subsurface conditions encountered at the boring locations.
- Site preparation considerations including material types to be expected during trench excavation operations, possible undercut considerations, as well as recommendations regarding handling and treatment of unsuitable soils, if encountered.
- Dewatering recommendations, if appropriate.
- Recommendations for trench backfill including relative compaction requirements, testing frequency, and criteria to establish suitable surfaces for structural backfill, if necessary.
- Boring logs that detail the materials encountered with soil classifications, penetration values, depth to bedrock (if encountered), and groundwater levels (if measured).
- Presentation of laboratory test results.
- Pile capacity recommendations for use in aerial crossing structure design.

3.0 GEOTECHNICAL SITE CHARACTERIZATION

The following paragraphs are intended to provide a general characterization of the site from a geotechnical engineering perspective. It is neither the intention of this report to address every potential geotechnical matter that may arise, nor to provide every possible interpretation of conditions encountered. The following condition descriptions and subsequent geotechnical recommendations have been prepared, in part, based on the assumption significant changes in subsurface conditions do not occur between boreholes. However, anomalous conditions can occur due to variations in existing fill that may be present at the site or due to natural variation in site geologic conditions. It will be necessary to evaluate actual conditions relative to those reported herein during the various project earthwork phases.

3.1 GEOLOGY

Appearing on the USGS *Geologic Map of North Carolina*, the project site is situated within the North Carolina Coastal Plain and is characterized by soils associated with the Middendorf Formation. These soils have been deposited over time as a result of erosion from rains and streams flowing toward the Atlantic Ocean. Per the literature, the general site area is underlain by terrace deposits and upland sediments consisting of unconsolidated clay, silt, and sand. These soils were deposited in a fairly dynamic receding ocean environment which occurred during the Cenozoic (65 million years of age) era. Conditions encountered in borings drilled for this study generally correlate to the published geological information.

3.2 EXISTING SURFACE CONDITIONS

At the time of our field work, the site was described gently rolling, with surface elevations ranging from approximately 130 to 180 feet MSL. It is understood that various excavation, trenching and undercutting operations will be necessary throughout the sewer installation process.

From a review of historical aerial photographs (Google Earth database) the site has been developed for residential housing dating from at least 1993 and has remained unaltered for the most part.

Ground vegetation consists of grass with small to mature trees and shrubs, typical of a residential neighborhood. Roadways, driveways, and auxiliary residential structures also occupy the area. Access to some homes and driveways will likely be affected during the construction phase.

3.3 SUBSURFACE CONDITIONS

A generalized stratification summary has been prepared using data from the soil test borings and is presented in the table below. The stratification depicts general soil conditions and strata types encountered during our field investigation.

Stratum No.	Typical Thickness	Description	Consistency / Relative Density
1	0.2 – 0.7 ft.	Asphalt	N/A
2	0.5 – 1.0 ft.	Topsoil	N/A
3	0.2 – 13.5 ft.	<i>Existing Fill:</i> Clayey Sand (SC), Silty Sand (SM)	Loose to Medium Dense
4	0.5 – 23.5 ft.	<i>Coastal Plain Sands:</i> Clayey Sand (SC), Silty Sand (SM), Poorly Graded Sand with Clay (SP-SC), Poorly Graded Sand with Silt (SP-SM)	Loose to Dense
5	4.0 – 20.0 ft.	<i>Clays:</i> Sandy Lean Clay (CL), Fat Clay & Sandy Fat Clay (CH)	Medium Stiff to Very Stiff

Table 3: Stratification Summary

Subsurface soil profiles have also been prepared using data obtained at the specific boring locations and are presented in the Appendix. For specific details on the information obtained from individual soil borings, please refer to the Boring Logs included in the Appendix. Ground surface elevations at the boring sites reported herein were estimated based upon elevation data provided by Fayetteville PWC through W.K. Dickson & Co., Inc.

3.3.1 ASPHALT

Sixteen (16) borings, including B-01 through B-04 and B-09 through B-20 were drilled through roadways as part of the subsurface exploration. A layer of asphalt was present in these borings, beginning from ground surface and extending as deep as 7 inches. No topsoil was observed in borings where asphalt existed at the surface.

3.3.2 TOPSOIL

Subsurface exploration was performed on residential property 4 borings; topsoil was encountered in these borings from the surface to depths approximately 6 to 12 inches. No testing has been performed to verify that these soils meet the technical parameters of “topsoil” (organic material and humus content). Therefore, topsoil depths reported on the boring logs should only be considered an estimate as actual conditions may vary across the site.

3.3.3 EXISTING FILL MATERIAL: CLAYEY SAND (SC), SILTY SAND (SM)

Existing fill material was encountered directly beneath the asphalt layer in all pavement borings. The fill material ranged approximately 3.5 to 8.5 feet below the existing ground surface and consisted of silty sand (SM) or clayey sand (SC). The fill material exhibits brown to brownish yellow colors and loose to medium-dense consistencies.

Four Atterberg limit tests were performed on select samples of the fill material. Two samples exhibited liquid limits (LL) in the range of 27 to 29, and plastic indices from 8 to 11. The remaining two samples yielded non-plastic (NP) results. Wash #200 grain size testing was performed on the samples and indicated approximately 15 to 22 percent passing the #200 sieve.

3.3.4 COASTAL PLAIN SANDS: SC, SM, SP-SC, SP-SM

A wide range of coastal plains soils were encountered beneath the existing fill material for pavement borings, and underneath topsoil for borings on residential property. These soils are generally described as clayey sand (SC), silty sand (SM), poorly graded sand with clay (SP-SC), and poorly graded sand with silt (SP-SM). This material occurred in generally alternating layers extending to boring termination depths. Generally exhibiting colors such as brownish yellow, reddish yellow and gray, these soils also had loose to dense consistencies.

Eleven samples were selected within the sand layers for Atterberg limit testing. Seven samples indicated liquid limits from 21 to 69, and plastic indices from 6 to 44. The remaining four samples yielded non-plastic results. Wash #200 testing was performed on the same eleven samples and indicated approximately 4 to 49 percent passing the #200 sieve.

3.3.5 CLAYS: SANDY LEAN CLAY (CLS), FAT CLAY & SANDY FAT CLAY (CH)

Coastal plains soils described as sandy lean clay (CLS) and fat clay (CH) were encountered in four borings across the site at locations B-05, and B-09 to B-11. These soils were encountered as shallow as 6 feet below ground surface and extended as deep as boring termination at 20 feet. Consistencies for these soils were stiff or very stiff.

Atterberg limit testing was performed on one clay sample and yielded a liquid limit of 60 and plasticity index of 31. Approximately 54 percent passed the #200 sieve during the wash #200 grain size testing.

3.3.6 AUGER REFUSAL

Auger refusal is the depth at which a borehole can no longer be advanced using soil drilling or hand augering procedures. Auger refusal can occur on hard soil, boulders, buried debris or bedrock. Coring is required to sample the material below auger refusal. Auger refusal did not occur in soil borings drilled for this study.

3.3.7 GROUNDWATER

At the time of drilling, groundwater was encountered in six borings. Five borings were left open for 24 hours to obtain stabilized water depths. Water levels reported are accurate only for the time and date the borings were drilled; long term monitoring of the boreholes was not included as part of our subsurface exploration. The borings were backfilled after a stabilized water level was recorded. Groundwater data is presented in following table:

Boring No.	Depth (ft)	Elevation (ft)	Stabilized Depth (ft)	Elevation (ft)
B-01	9.0	194.0	8.5	194.5
B-02	13.5	188.0	10.5	191.0
B-03	15.0	188.5	11.0	192.5
B-04	8.5	184.5	6.0	187.0
B-07	8.0	181.0	5.5	183.5
B-08	4.0	183.0	-	-

Table 4: Groundwater Depths

4.0 SITE DEVELOPMENT CONSIDERATIONS

A grading plan was not available at the time of this reporting. However, it is our understanding that various excavation and undercutting operations may be required during the construction process. Primary geotechnical matters affecting this project are:

- Moisture sensitive soils encountered across the site.
- Proper site preparation and placement of backfill.
- Potential for excavations encountering local or regional groundwater tables.

The following report sections provide recommendations regarding site preparation.

4.1 INITIAL SITE PREPARATION

All trees, roots, topsoil, pavement, and deleterious materials should be removed from proposed construction areas. Approximately 6 to 12 inches of topsoil were observed in the hand auger borings. A geotechnical engineer should observe stripping and grubbing operations to confirm all unsuitable materials are removed from proposed construction areas.

Because the site is an active residential area, buried structures could be encountered such as foundations, utility lines, septic tanks, etc. If encountered, they should be removed and backfilled in accordance with requirements outlined in the Structural Fill section of this report. Materials disturbed during clearing operations should be stabilized in place or, if necessary, undercut to undisturbed materials and backfilled with properly compacted, approved structural fill.

4.2 DEWATERING

In order to install new underground utilities, both surface water and groundwater will need to be managed effectively. To the extent possible, managing surface water runoff should be accomplished by grading sections of the site to promote positive drainage way from active work areas. We expect this will include construction of temporary swales and basins to catch water and divert run-off to areas that will affect the active work area less. Pumping from sump areas should be expected. This will likely require a staged construction approach that will allow small work areas to be adequately dewatered.

Additionally, if the sanitary sewer will be bedded in washed stone, there is a high potential for groundwater to drain to this stone layer, and flow to lower areas of the site. Groundwater will daylight through any penetrations to this stone bedding material if groundwater pressure is allowed to build up. For this reason, the termination end of the sewer should be designed to relieve the build-up of pressure through a French drain that is able to daylight below the lowest elevation of the stone bedding.

4.3 SUBGRADE EVALUATION

Some instability of the surface soils may exist during construction, depending on climatic and other factors immediately preceding and during construction. If any soft or otherwise unstable soils are identified during construction the geotechnical engineer of record or his representative should evaluate the subgrade soils. This evaluation will include a review of the site conditions and providing recommendations for repair.

4.4 MOISTURE SENSITIVE SOILS

Moisture sensitive silty sands (SM), clayey sands (SC), poorly graded sands with clay (SP-SC) and poorly graded sands with silt (SP-SM) were encountered across most of the site during the subsurface exploration. These soils will degrade if allowed to become saturated. Therefore, not allowing water to pond by maintaining positive drainage and temporary dewatering methods (if required) is important to help avoid degradation and softening of the soils.

The contractor should anticipate some difficulty during the earthwork phase of this project if moisture levels are moderate to high during construction. Increased moisture levels will soften the subgrade and the soils may become unstable under the influence of construction traffic. Accordingly, construction during wet weather conditions should be avoided, as this could result in soft and unstable soil conditions that would require ground modification, such as in place stabilization or undercutting.

4.5 STRUCTURAL FILL

Requirements for structural fill on this project are as follows:

Soil Type	USCS Classification	Property Requirements	Placement Location
Sand and Gravel	GW, GP, GM, SW, SP, SM or combinations	Maximum 2" particle size	Fill and Backfill
Clay	CL, SC, GC	LL < 50, PI < 25, γ_d > 100 pcf	Fill and Backfill
Clay	CH	LL > 50, PI > 25, γ_d > 100 pcf	Fill and Backfill: 36 inches below FSG
Silt	ML, MH	N/A	Not recommended as structural fill
On-site soils	SC, SM, SP-SC, SP-SM, CL, CH	As listed above	As listed above

Table 5: Structural Fill Requirements

Notes:

1. LL indicates the soil Liquid Limit; PI indicates the soil Plasticity Index; γ_d indicates the maximum dry density as defined by the density standard outlined in the table below.
2. Laboratory testing of the soils proposed for fill must be performed in order to verify their conformance with the above recommendations.
3. Any fill to be placed at the site should be reviewed by the geotechnical engineer.

Placement requirements for structural fill are as follows:

Specification	Requirement
Lift Thickness	8" loose, 6" compacted
Density	95 Percent maximum per ASTM D-698 all non-structural areas 98 Percent maximum per ASTM D-698, all structural areas within 4 feet of finished subgrade 95 Percent maximum per ASTM D-698 all structural areas below 4 feet of finished subgrade
Moisture	±3.0 Percentage Points ASTM D-698 Optimum
Density Testing Frequency	1 test per 250 LF, per lift

Table 6: Structural Fill Placement Requirements

4.6 EXCAVATION CONSIDERATIONS

All excavations performed at the site should follow OSHA guidelines for temporary excavations. Excavated soils should be stockpiled according to OSHA regulations to limit the potential cave-in of soils.

4.6.1 GROUNDWATER

Groundwater was encountered at depths from 4.0 to 15.0 feet in 6 of the 20 borings at time of drilling. **Groundwater could be encountered during construction, particularly during undercutting operations.** It should be noted that fluctuations in the water level could occur due to seasonal variations in rainfall. The contractor must be prepared to remove groundwater seepage from excavations if encountered during construction. Excavations extending below groundwater levels will require dewatering systems (such as well points, sump pumps or trench drains). The contractor should evaluate the most economical and practical dewatering method.

4.7 UTILITY TRENCH BACKFILL

All utility trenches must be backfilled and compacted in the manner specified above for structural fill. It may be necessary to reduce the lift thickness to 4 to 6 inches to achieve compaction using hand-operated equipment.

4.8 LANDSCAPING AND DRAINAGE CONSIDERATIONS

The potential for soil moisture fluctuations within building areas and pavement subgrades should be reduced to lessen the potential of subgrade movement. Site grading should include positive drainage away from buildings and pavements. Excessive irrigation of landscaping poses a risk of saturating and softening soils below shallow footings and pavements, which could result in settlement of footings and premature failure of pavements.

4.9 WET WEATHER CONSTRUCTION

Excessive movement of construction equipment across the site during wet weather may result in ruts, which will collect rainwater, prolonging the time required to dry the subgrade soils.

During rainy periods, additional effort will be required to properly prepare the site and establish/maintain an acceptable subgrade. The difficulty will increase in areas where clay or silty soils are exposed at the subgrade elevation. Grading contractors typically postpone grading operations during wet weather to wait for conditions that are more favorable. Contractors can typically disk or aerate the upper soils to promote drying during intermittent periods of favorable weather. When deadlines restrict postponement of grading operations, additional measures such as undercutting and replacing saturated soils or stabilization can be utilized to facilitate placement of additional fill material.

5.0 FOUNDATION RECOMMENDATIONS

We understand pile foundations are planned for an aerial crossing within a ravine near borings B-02 and B-03. Based upon correspondence with the structural engineer, the piles will need to develop a gravity axial load of 10 tons, with an estimated lateral load at top of 4 kips. ***If this structural loading is incorrect, our office should be contacted, such that our recommendations can be reviewed.***

5.1 PILE FOUNDATIONS

Based upon correspondence with the structural engineer, we understand that desired pile capacity for the sewer crossing will be on the order of 10 tons (20 kips). Furthermore, it is understood that 18-to-24-inch steel pipe displacement piles, and HP12x53 non-displacement piles are being considered. **Because medium dense to dense soils were encountered within the soil profile, pre-drilling will likely be required for displacement pile installation.** Piles embedded in grout filled pre-drilled boreholes is considered an appropriate alternative.

Estimated pile capacities with respect to depth are summarized in Tables 8 through 11, below. Pile capacity calculations have been performed in accordance with the Meyerhof Method and are estimated based upon SPT sampling data gathered from the field exploration.

Estimated Pile Capacities – 18 in. Pipe Pile		
Pile Depth (ft.)	Capacity (kips)	
	Ultimate	Allowable (FS=3)
8	91	30
10	142	47
12	170	56

Proper site preparation, construction techniques, and quality control are critical to the integrity of the deep foundation system. These construction efforts should be monitored and documented by a representative of the geotechnical engineer. Our evaluation did not include a scour analysis or slope stability analysis.

6.0 CONSTRUCTION MONITORING

Field verification of site conditions is an essential part of the services provided by the geotechnical consultant. In order to confirm our recommendations, it will be necessary for Building & Earth personnel to make periodic visits to the site during site grading. Typical construction monitoring services are listed below.

- Fill and backfill monitoring.
- Compaction and moisture content testing.

7.0 CLOSING AND LIMITATIONS

This report was prepared for W.K. Dickson & Co., Inc., for specific application to the PWC Phase V Area 27 Annexation located in Fayetteville, North Carolina. The information in this report is not transferable. This report should not be used for a different development on the same property without first being evaluated by the engineer.

The recommendations in this report were based on the information obtained from our field exploration and laboratory analysis. The data collected is representative of the locations tested. Variations are likely to occur at other locations throughout the site. Engineering judgment was applied in regard to conditions between borings. It will be necessary to confirm the anticipated subsurface conditions during construction.

This report has been prepared in accordance with generally accepted standards of geotechnical engineering practice. No other warranty is expressed or implied. In the event that changes are made, or anticipated to be made, to the nature, design, or location of the project as outlined in this report, Building & Earth must be informed of the changes and given the opportunity to either verify or modify the conclusions of this report in writing, or the recommendations of this report will no longer be valid.

The scope of services for this project did not include any environmental assessment of the site or identification of pollutants or hazardous materials or conditions. If the owner is concerned about environmental issues Building & Earth would be happy to provide an additional scope of services to address those concerns.

GEOTECHNICAL INVESTIGATION METHODOLOGIES

The subsurface exploration, which is the basis of the recommendations of this report, has been performed in accordance with industry standards. Detailed methodologies employed in the investigation are presented in the following sections.

DRILLING PROCEDURES – STANDARD PENETRATION TEST (ASTM D1586)

At each boring location, soil samples were obtained at standard sampling intervals with a split-spoon sampler. The borehole was first advanced to the sample depth by augering and the sampling tools were placed in the open hole. The sampler was then driven 18 inches into the ground with a 140-pound manual hammer free-falling 30 inches. The number of blows required to drive the sampler each 6-inch increment was recorded. The initial increment is considered the “seating” blows, where the sampler penetrates loose or disturbed soil in the bottom of the borehole.

The blows required to penetrate the final two (2) increments are added together and are referred to as the Standard Penetration Test (SPT) N-value. The N-value, when properly evaluated, gives an indication of the soil’s strength and ability to support structural loads. Many factors can affect the SPT N-value, so this result cannot be used exclusively to evaluate soil conditions.

The SPT testing was performed using a drill rig equipped with a manual hammer. Manual hammers are dropped using a manually operated rope and cathead system. The N-values discussed or mentioned in this report and shown on the boring logs are recorded field values.

Samples retrieved from the boring locations were labeled and stored in plastic bags at the jobsite before being transported to our laboratory for analysis. The project engineer prepared Boring Logs summarizing the subsurface conditions at the boring locations.

HAND AUGER BORINGS AND DYNAMIC CONE PENETRATION TESTING

Hand auger borings were drilled with a 3-inch diameter auger to advance the hole below the existing grade. A Building & Earth representative collected samples of the subsurface soils at regular depth intervals and at depths where a change in lithology occurred.

Dynamic Cone Penetration (DCP) testing was performed in the hand auger borings to evaluate the consistency of the subgrade soils. The DCP apparatus consists of a steel, cylindrical shaft with a conical tip at the end. The conical tip measures 1.5-inches in diameter, with a 45° tip angle. A 15-pound sliding ring weight is mounted to the shaft. When dropped from a height of 20 inches, the ring weight strikes a steel anvil, driving the point into the soil. After seating the point into the soil 2 inches, the weight is dropped until the shaft travels an interval of 1.75 inches. The number of blows necessary to drive the tip each 1.75-inch increment is recorded. Given the material type and certain soil properties,

this number can then be correlated to the Standard Penetration Test (ASTM D1586) N-values. The DCP test results are shown under the "Remarks" column on the boring logs.

BULK SAMPLING

Bulk sample are obtained for the evaluation of the compaction characteristics of the site soils and for determination of the California Bearing Ratio (CBR). The bulk samples are obtained from manual excavations, backhoe test pits, or from auger cutting. Similar soils are normally combined to provide samples of adequate size for compaction or CBR testing.

BORING LOG DESCRIPTION

Building & Earth Sciences, Inc. used the gINT software program to prepare the attached boring logs. The gINT program provides the flexibility to custom design the boring logs to include the pertinent information from the subsurface exploration and results of our laboratory analysis. The soil and laboratory information included on our logs is summarized below:

DEPTH AND ELEVATION

The depth below the ground surface and the corresponding elevation are shown in the first two columns.

SAMPLE TYPE

The method used to collect the sample is shown. The typical sampling methods include Split Spoon Sampling, Shelby Tube Sampling, Grab Samples, and Rock Core. A key is provided at the bottom of the log showing the graphic symbol for each sample type.

SAMPLE NUMBER

Each sample collected is numbered sequentially.

BLOWS PER INCREMENT, REC%, RQD%

When Standard Split Spoon sampling is used, the blows required to drive the sampler each 6-inch increment are recorded and shown in column 5. When rock core is obtained the recovery ratio (REC%) and Rock Quality Designation (RQD%) is recorded.

SOIL DATA

Column 6 is a graphic representation of four different soil parameters. Each of the parameters use the same graph, however, the values of the graph subdivisions vary with each parameter. Each parameter presented on column 6 is summarized below:

- **N-value**- The Standard Penetration Test N-value, obtained by adding the number of blows required to drive the sampler the final 12 inches, is recorded. The graph labels range from 0 to 50.
- **Qu** – Unconfined Compressive Strength estimate from the Pocket Penetrometer test in tons per square foot (tsf). The graph labels range from 0 to 5 tsf.
- **Atterberg Limits** – The Atterberg Limits are plotted with the plastic limit to the left, and liquid limit to the right, connected by a horizontal line. The difference in the plastic and liquid limits is referred to as the Plasticity Index. The Atterberg Limits test results are also included in the Remarks column on the far right of the boring log. The Atterberg Limits graph labels range from 0 to 100%.
- **Moisture** – The Natural Moisture Content of the soil sample as determined in our laboratory.

SOIL DESCRIPTION

The soil description prepared in accordance with ASTM D2488, Visual Description of Soil Samples. The Munsel Color chart is used to determine the soil color. Strata changes are indicated by a solid line, with the depth of the change indicated on the left side of the line and the elevation of the change indicated on the right side of the line. If subtle changes within a soil type occur, a broken line is used. The Boring Termination or Auger Refusal depth is shown as a solid line at the bottom of the boring.

GRAPHIC

The graphic representation of the soil type is shown. The graphic used for each soil type is related to the Unified Soil Classification chart. A chart showing the graphic associated with each soil classification is included.

REMARKS

Remarks regarding borehole observations, and additional information regarding the laboratory results and groundwater observations.

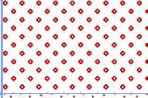

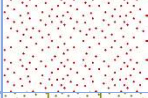

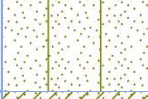

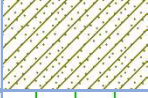

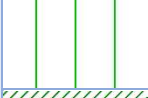

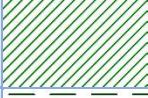

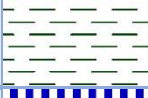

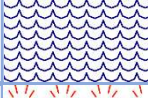

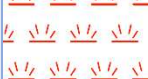

Major Divisions			Symbols		Group Name & Typical Description	
			Lithology	Group		
Coarse Grained Soils More than 50% of material is larger than No. 200 sieve size	Gravel and Gravelly Soils More than 50% of coarse fraction is larger than No. 4 sieve	Clean Gravels (Less than 5% fines)		GW	Well-graded gravels, gravel – sand mixtures, little or no fines	
				GP	Poorly-graded gravels, gravel – sand mixtures, little or no fines	
		Gravels with Fines (More than 12% fines)		GM	Silty gravels, gravel – sand – silt mixtures	
				GC	Clayey gravels, gravel – sand – clay mixtures	
	Sand and Sandy Soils More than 50% of coarse fraction is smaller than No. 4 sieve	Clean Sands (Less than 5% fines)		SW	Well-graded sands, gravelly sands, little or no fines	
				SP	Poorly-graded sands, gravelly sands, little or no fines	
		Sands with Fines (More than 12% fines)		SM	Silty sands, sand – silt mixtures	
				SC	Clayey sands, sand – clay mixtures	
	Fine Grained Soils More than 50% of material is smaller than No. 200 sieve size	Silts and Clays Liquid Limit less than 50	Inorganic		ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silt with slight plasticity
					CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
Organic				OL	Organic silts and organic silty clays of low plasticity	
				MH	Inorganic silts, micaceous or diatomaceous fine sand, or silty soils	
Silts and Clays Liquid Limit greater than 50		Inorganic		CH	Inorganic clays of high plasticity	
				OH	Organic clays of medium to high plasticity, organic silts	
		Highly Organic Soils		PT	Peat, humus, swamp soils with high organic contents	

Table 1: Soil Classification Chart (based on ASTM D2487)

Building & Earth Sciences classifies soil in general accordance with the Unified Soil Classification System (USCS) presented in ASTM D2487. Table 1 and Figure 1 exemplify the general guidance of the USCS. Soil consistencies and relative densities are presented in general accordance with Terzaghi, Peck, & Mesri's (1996) method, as shown on Table 2, when quantitative field and/or laboratory data is available. Table 2 includes Consistency and Relative Density correlations with N-values obtained using either a manual hammer (60 percent efficiency) or automatic hammer (90 percent efficiency). The *Blows Per Increment* and *SPT N-values* displayed on the boring logs are the unaltered values measured in the field. When field and/or laboratory data is not available, we may classify soil in general accordance with the Visual Manual Procedure presented in ASTM D2488.

Figure 1: Plasticity Chart (based on ASTM D2487)

Non-cohesive: Coarse-Grained Soil		Cohesive: Fine-Grained Soil				
SPT Penetration (blows/foot)		Relative Density	SPT Penetration (blows/foot)		Consistency	Estimated Range of Unconfined Compressive Strength (tsf)
			Automatic Hammer*	Manual Hammer		
Automatic Hammer*	Manual Hammer		< 2	< 2	Very Soft	< 0.25
0 - 3	0 - 4	Very Loose	2 - 3	2 - 4	Soft	0.25 – 0.50
3 - 8	4 - 10	Loose	3 - 6	4 - 8	Medium Stiff	0.50 – 1.00
8 - 23	10 - 30	Medium Dense	6 - 12	8 - 15	Stiff	1.00 – 2.00
23 - 38	30 - 50	Dense	12 - 23	15 - 30	Very Stiff	2.00 – 4.00
> 38	> 50	Very Dense	> 23	> 30	Hard	> 4.00

Table 2: Soil Consistency and Relative Density (based on Terzaghi, Peck & Mesri, 1996)

* - Modified based on 80% hammer efficiency

	Standard Penetration Test ASTM D1586 or AASHTO T-206		Dynamic Cone Penetrometer (Sower DCP) ASTM STP-399
	Shelby Tube Sampler ASTM D1587		No Sample Recovery
	Rock Core Sample ASTM D2113		Groundwater at Time of Drilling
	Auger Cuttings		Groundwater as Indicated

Table 1: Symbol Legend

Soil	Particle Size	U.S. Standard
Boulders	Larger than 300 mm	N.A.
Cobbles	300 mm to 75 mm	N.A.
Gravel	75 mm to 4.75 mm	3-inch to #4 sieve
Coarse	75 mm to 19 mm	3-inch to ¾-inch sieve
Fine	19 mm to 4.75 mm	¾-inch to #4 sieve
Sand	4.75 mm to 0.075 mm	#4 to #200 Sieve
Coarse	4.75 mm to 2 mm	#4 to #10 Sieve
Medium	2 mm to 0.425 mm	#10 to #40 Sieve
Fine	0.425 mm to 0.075 mm	#40 to #200 Sieve
Fines	Less than 0.075 mm	Passing #200 Sieve
Silt	Less than 5 µm	N.A.
Clay	Less than 2 µm	N.A.

Table 2: Standard Sieve Sizes

N-Value 	Standard Penetration Test Resistance calculated using ASTM D1586 or AASHTO T-206. Calculated as sum of original, field recorded values.	Atterberg Limits 	A measure of a soil's plasticity characteristics in general accordance with ASTM D4318. The soil Plasticity Index (PI) is representative of this characteristic and is bracketed by the Liquid Limit (LL) and the Plastic Limit (PL).
Qu 	Unconfined compressive strength, typically estimated from a pocket penetrometer. Results are presented in tons per square foot (tsf).	% Moisture 	Percent natural moisture content in general accordance with ASTM D2216.

Table 3: Soil Data

Hollow Stem Auger	Flights on the outside of the shaft advance soil cuttings to the surface. The hollow stem allows sampling through the middle of the auger flights.
Mud Rotary / Wash Bore	A cutting head advances the boring and discharges a drilling fluid to support the borehole and circulate cuttings to the surface.
Solid Flight Auger	Flights on the outside bring soil cuttings to the surface. Solid stem requires removal from borehole during sampling.
Hand Auger	Cylindrical bucket (typically 3-inch diameter and 8 inches long) attached to a metal rod and turned by human force.

Table 4: Soil Drilling Methods

Descriptor	Meaning
Trace	Likely less than 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

Table 5: Descriptors

Manual Hammer	The operator tightens and loosens the rope around a rotating drum assembly to lift and drop a sliding, 140-pound hammer falling 30 inches.
Automatic Trip Hammer	An automatic mechanism is used to lift and drop a sliding, 140-pound hammer falling 30 inches.
Dynamic Cone Penetrometer (Sower DCP) ASTM STP-399	Uses a 15-pound steel mass falling 20 inches to strike an anvil and cause penetration of a 1.5-inch diameter cone seated in the bottom of a hand augered borehole. The blows required to drive the embedded cone a depth of 1-3/4 inches have been correlated by others to N-values derived from the Standard Penetration Test (SPT).

Table 6: Sampling Methods

Non-plastic	A 1/8-inch thread cannot be rolled at any water content.
Low	The thread can barely be rolled and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be re-rolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be re-rolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

Table 7: Plasticity

Dry	Absence of moisture, dusty, dry to the touch.
Moist	Damp but no visible water.
Wet	Visible free water, usually soil is below water table.

Table 8: Moisture Condition

Stratified	Alternating layers of varying material or color with layers at least 1/2 inch thick.
Laminated	Alternating layers of varying material or color with layers less than 1/4 inch thick.
Fissured	Breaks along definite planes of fracture with little resistance to fracturing.
Slickensides	Fracture planes appear polished or glossy, sometimes striated.
Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown.
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay.
Homogeneous	Same color and appearance throughout.

Table 9: Structure

Hatch	Description	Hatch	Description	Hatch	Description

LABORATORY TEST PROCEDURES

A brief description of the laboratory tests performed is provided in the following sections.

DESCRIPTION OF SOILS (VISUAL-MANUAL PROCEDURE) (ASTM D2488)

The soil samples were visually examined by our engineer and soil descriptions were provided. Representative samples were then selected and tested in accordance with the aforementioned laboratory-testing program to determine soil classifications and engineering properties. This data was used to correlate our visual descriptions with the Unified Soil Classification System (USCS).

POCKET PENETROMETER

Pocket Penetrometer tests were performed on cohesive soil samples. The pocket penetrometer provides a consistency classification, and an indication of the soils unconfined compressive strength (Q_u).

NATURAL MOISTURE CONTENT (ASTM D2216)

Natural moisture contents (M%) were determined on selected samples. The natural moisture content is the ratio, expressed as a percentage, of the weight of water in a given amount of soil to the weight of solid particles.

ATTERBERG LIMITS (ASTM D4318)

The Atterberg Limits test was performed to evaluate the soil's plasticity characteristics. The soil Plasticity Index (PI) is representative of this characteristic and is bracketed by the Liquid Limit (LL) and the Plastic Limit (PL). The Liquid Limit is the moisture content at which the soil will flow as a heavy viscous fluid. The Plastic Limit is the moisture content at which the soil is between "plastic" and the semi-solid stage. The Plasticity Index ($PI = LL - PL$) is a frequently used indicator for a soil's potential for volume change. Typically, a soil's potential for volume change increases with higher plasticity indices.

GRAIN-SIZE DISTRIBUTION (ASTM D6913)

Soil grain-size distribution includes determining percentages of material sizes for the soils sample. The wash determines the amount of material finer than the openings on the No. 200 sieve (0.075 mm) by washing soil over it. After drying in the oven, the soils retained on the No. 200 sieve are separated into specified grain sizes by running through sieves with consecutively smaller openings. The result is a distribution of particle sized that make up the bulk sample. Results are presented on the boring logs and Laboratory Results section included in this report.

STANDARD PROCTOR COMPACTION TEST (ASTM D698)

Standard Proctor compaction tests were performed to determine the maximum dry density and optimum moisture content for the soil, for use as a comparative basis during fill placement. The Standard Proctor test consists of the compaction of soil with known moisture content into a steel mold of fixed height and diameter. The soil is compacted in the mold in three lifts of equal volume using a 5.5 lb. manual hammer with a 12-inch free fall, to produce a consistent

compactive effort. The test procedure is repeated on samples at several different moisture contents until a curve showing the relationship between moisture content and dry density of the soil is established. From this curve, the maximum dry density (peak density value) and optimum moisture content (moisture content correlating to the maximum dry density) are obtained.

WATER SOLUBLE CHLORIDE AND SULFATE, RESISTIVITY AND PH (DIPRA)

Representative samples of soil and groundwater were collected and analyzed for corrosive potential according to methods specified by the Ductile Iron Pipe Research Association (DIPRA). The quantity and levels of sulfates, chlorides, resistivity, and pH were determined. These tests were performed in order to obtain information regarding the soil's relative ability to transmit electrical currents and thus, corrode metals placed in contact with it. Soil sulfate content tests were performed to evaluate sulfate attack on buried concrete. The test results are compared to published standards applicable to the project construction for assignment of corrosion potential ratings.

LABORATORY TEST RESULTS

The results of the laboratory testing are presented in the following tables.

BORING NO.	DEPTH	MOISTURE CONTENT (%)	LIQUID LIMIT	PLASTIC LIMIT	PLASTICITY INDEX	% PASSING #200 SIEVE	CLASSIFICATION

TABLE L-1: General Soil Classification Test Results

Soils with a Liquid Limit (LL) greater than 50 and Plasticity Index (PI) greater than 25 usually exhibit significant volume change with varying moisture content and are considered to be highly plastic

⁽¹⁾ Indicates visual classification. WR indicates weathered rock.

2,500-3,000	1
>3,000	0
pH	
0-2	5
2-4	3
4-6.5	0
6.5-7.5	0 ‡
7.5-8.5	0
>8.5	3
Redox potential (mV)	
> +100 mV	0
+50 to +100 mV	3.5
0 to +50 mV	4
Negative	5
Sulfides	
Positive	3.5
Trace	2
Negative	0
Moisture	
Poor drainage, continuously wet	2
Fair drainage, generally moist	1
Good drainage, generally dry	0

Soil Sample Location:	<u>B-01</u>
Sample Depth/Elevation:	<u>3.5-5'</u>
Soil Description:	<u>Silty Sand (SM)</u>
Sample Number:	<u>Bulk Sample</u>
Evaluation Data:	
Test	Results Point Value
Resistivity (ohm-cm):	<u>83,000</u> 0
pH:	<u>7.30</u> 0
Redox Potential (mV):	<u>217</u> 0
Sulfides:	<u>Trace</u> 2
Moisture:	<u>Fair</u> 1
Point Total -	3

Soil Sample Location:	<u>B-03</u>
Sample Depth/Elevation:	<u>6-7.5'</u>
Soil Description:	<u>Clayey Sand (SC)</u>
Sample Number:	<u>S4</u>
Evaluation Data:	
Test	Results Point Value
Resistivity (ohm-cm):	<u>89,000</u> 0
pH:	<u>6.23</u> 0
Redox Potential (mV):	<u>192</u> 0
Sulfides:	<u>Negative</u> 0
Moisture:	<u>Fair</u> 1
Point Total -	1

* A sum of 10 points from all tests indicates that the soil is corrosive to ductile iron pipe

‡ If sulfides are present and low or negative redox-potential results are obtained, add three points to this range.

Important Information about This

Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

Geotechnical Services Are Performed for Specific Purposes, Persons, and Projects

Geotechnical engineers structure their services to meet the specific needs of their clients. A geotechnical-engineering study conducted for a civil engineer may not fulfill the needs of a constructor — a construction contractor — or even another civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client. No one except you should rely on this geotechnical-engineering report without first conferring with the geotechnical engineer who prepared it. *And no one — not even you — should apply this report for any purpose or project except the one originally contemplated.*

Read the Full Report

Serious problems have occurred because those relying on a geotechnical-engineering report did not read it all. Do not rely on an executive summary. Do not read selected elements only.

Geotechnical Engineers Base Each Report on a Unique Set of Project-Specific Factors

Geotechnical engineers consider many unique, project-specific factors when establishing the scope of a study. Typical factors include: the client's goals, objectives, and risk-management preferences; the general nature of the structure involved, its size, and configuration; the location of the structure on the site; and other planned or existing site improvements, such as access roads, parking lots, and underground utilities. Unless the geotechnical engineer who conducted the study specifically indicates otherwise, do not rely on a geotechnical-engineering report that was:

- not prepared for you;
- not prepared for your project;
- not prepared for the specific site explored; or
- completed before important project changes were made.

Typical changes that can erode the reliability of an existing geotechnical-engineering report include those that affect:

- the function of the proposed structure, as when it's changed from a parking garage to an office building, or from a light-industrial plant to a refrigerated warehouse;
- the elevation, configuration, location, orientation, or weight of the proposed structure;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project changes—even minor ones—and request an

assessment of their impact. *Geotechnical engineers cannot accept responsibility or liability for problems that occur because their reports do not consider developments of which they were not informed.*

Subsurface Conditions Can Change

A geotechnical-engineering report is based on conditions that existed at the time the geotechnical engineer performed the study. *Do not rely on a geotechnical-engineering report whose adequacy may have been affected by:* the passage of time; man-made events, such as construction on or adjacent to the site; or natural events, such as floods, droughts, earthquakes, or groundwater fluctuations. *Contact the geotechnical engineer before applying this report to determine if it is still reliable.* A minor amount of additional testing or analysis could prevent major problems.

Most Geotechnical Findings Are Professional Opinions

Site exploration identifies subsurface conditions only at those points where subsurface tests are conducted or samples are taken. Geotechnical engineers review field and laboratory data and then apply their professional judgment to render an opinion about subsurface conditions throughout the site. Actual subsurface conditions may differ — sometimes significantly — from those indicated in your report. Retaining the geotechnical engineer who developed your report to provide geotechnical-construction observation is the most effective method of managing the risks associated with unanticipated conditions.

A Report's Recommendations Are Not Final

Do not overrely on the confirmation-dependent recommendations included in your report. *Confirmation-dependent recommendations are not final*, because geotechnical engineers develop them principally from judgment and opinion. Geotechnical engineers can finalize their recommendations *only* by observing actual subsurface conditions revealed during construction. *The geotechnical engineer who developed your report cannot assume responsibility or liability for the report's confirmation-dependent recommendations if that engineer does not perform the geotechnical-construction observation required to confirm the recommendations' applicability.*

A Geotechnical-Engineering Report Is Subject to Misinterpretation

Other design-team members' misinterpretation of geotechnical-engineering reports has resulted in costly

problems. Confront that risk by having your geotechnical engineer confer with appropriate members of the design team after submitting the report. Also retain your geotechnical engineer to review pertinent elements of the design team's plans and specifications. Constructors can also misinterpret a geotechnical-engineering report. Confront that risk by having your geotechnical engineer participate in prebid and preconstruction conferences, and by providing geotechnical construction observation.

Do Not Redraw the Engineer's Logs

Geotechnical engineers prepare final boring and testing logs based upon their interpretation of field logs and laboratory data. To prevent errors or omissions, the logs included in a geotechnical-engineering report should *never* be redrawn for inclusion in architectural or other design drawings. Only photographic or electronic reproduction is acceptable, *but recognize that separating logs from the report can elevate risk.*

Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can make constructors liable for unanticipated subsurface conditions by limiting what they provide for bid preparation. To help prevent costly problems, give constructors the complete geotechnical-engineering report, *but* preface it with a clearly written letter of transmittal. In that letter, advise constructors that the report was not prepared for purposes of bid development and that the report's accuracy is limited; encourage them to confer with the geotechnical engineer who prepared the report (a modest fee may be required) and/or to conduct additional study to obtain the specific types of information they need or prefer. A prebid conference can also be valuable. *Be sure constructors have sufficient time to perform additional study.* Only then might you be in a position to give constructors the best information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions.

Read Responsibility Provisions Closely

Some clients, design professionals, and constructors fail to recognize that geotechnical engineering is far less exact than other engineering disciplines. This lack of understanding has created unrealistic expectations that have led to disappointments, claims, and disputes. To help reduce the risk of such outcomes, geotechnical engineers commonly include a variety of explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help

others recognize their own responsibilities and risks. *Read these provisions closely.* Ask questions. Your geotechnical engineer should respond fully and frankly.

Environmental Concerns Are Not Covered

The equipment, techniques, and personnel used to perform an *environmental* study differ significantly from those used to perform a *geotechnical* study. For that reason, a geotechnical-engineering report does not usually relate any environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated environmental problems have led to numerous project failures.* If you have not yet obtained your own environmental information, ask your geotechnical consultant for risk-management guidance. *Do not rely on an environmental report prepared for someone else.*

Obtain Professional Assistance To Deal with Mold

Diverse strategies can be applied during building design, construction, operation, and maintenance to prevent significant amounts of mold from growing on indoor surfaces. To be effective, all such strategies should be devised for the *express purpose* of mold prevention, integrated into a comprehensive plan, and executed with diligent oversight by a professional mold-prevention consultant. Because just a small amount of water or moisture can lead to the development of severe mold infestations, many mold-prevention strategies focus on keeping building surfaces dry. While groundwater, water infiltration, and similar issues may have been addressed as part of the geotechnical-engineering study whose findings are conveyed in this report, the geotechnical engineer in charge of this project is not a mold prevention consultant; *none of the services performed in connection with the geotechnical engineer's study were designed or conducted for the purpose of mold prevention. Proper implementation of the recommendations conveyed in this report will not of itself be sufficient to prevent mold from growing in or on the structure involved.*

Rely, on Your GBC-Member Geotechnical Engineer for Additional Assistance

Membership in the Geotechnical Business Council of the Geoprofessional Business Association exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project. Confer with you GBC-Member geotechnical engineer for more information.

APPENDIX G

Easement Special Conditions- Area 27 Cliffdale Forest

Property Owner	Parcel Number	Address	Special Conditions
Todd A. Mercer	9487-22-0432	6916 ST. Julian Way	Concerned about shed on the south-eastern corner. Power and internet/cable going to shed if disturbed wants it repaired.
George C. Proctor & wife Alverta	9487-22-4301	6936 ST. Julian Way	Needs temporary fencing for grandchildren.
S & T Property Management, LLC	9487-22-3281	Lisa Ave, Sanchez Dr. Bridgette St,	No special conditions.
Barbara Goldentyer Spouse, Sierra Moore	9487-31-0755	8753 Grouse Run Ln.	No vehicles parked in driveway hours of construction, which way contractors coming onto property people walking onto their property since wooded area being removed. Temporary fencing. Keep as many trees as possible. If no trespassing could be put up by contractors. If they bought a gate can the contractors put it up.
Napolean Thomas II	9486-28-2581	1148 Patrick Dr.	No special conditions.
Kelvin A. Thorpe and wife Kelle Thorpe	9486-28-3489	1152 Patrick Dr.	No special conditions.
John A. McBryde Deborah McBryde	9486-28-8302	1200 Patrick Dr.	Dish in only place that can get clear reception. Mr. Autry said dish possibly could be placed back in the same location. If not PWC will request the location of the dish on PUE.
Ronnie J. Holliday and Wife Loretta Holliday	9846-39-0750	7590 Beverly Drive	Mr. Autry said they would put down seed for erosion. Then come back and grade the land and put down centipede on city and property side.
